### Geospatial Analysis for Optimization at Environmental Sites

#### Geospatial Analysis for Optimization at Environmental Sites (GRO-1) Guidance Document

Sponsored by: Interstate Technology and Regulatory Council ([www.itrcweb.org](http://www.itrcweb.org))  
Hosted by: US EPA Clean Up Information Network ([www.cluin.org](http://www.cluin.org))

**Training Course Overview:** Optimization activities can improve performance, increase monitoring efficiency, and support contaminated site decisions. Project managers can use geospatial analysis for evaluation of optimization opportunities. Unlike traditional statistical analysis, geospatial methods incorporate the spatial and temporal dependence between nearby data points, which is an important feature of almost all data collected as part of an environmental investigation. The results of geospatial analyses add additional lines of evidence to decision making in optimization opportunities in environmental sites across all project life cycle stages (release detection, site characterization, remediation, monitoring and closure) in soil, groundwater or sediment remediation projects for different sizes and types of sites.

The purpose of [ITRC's Geospatial Analysis for Optimization at Environmental Sites \(GRO-1\)](#) guidance document and this associated training is to explain, educate, and train state regulators and other practitioners in understanding and using geospatial analyses to evaluate optimization opportunities at environmental sites. With the ITRC GRO-1 web-based guidance document and this associated training class, project managers will be able to:

- Evaluate available data and site needs to determine if geospatial analyses are appropriate for a given site
- For a project and specific lifecycle stage, identify optimization questions where geospatial methods can contribute to better decision making
- For a project and optimization question(s), select appropriate geospatial method(s) and software using the geospatial analysis work flow, tables and flow charts in the guidance document
- With geospatial analyses results (note: some geospatial analyses may be performed by the project manager, but many geospatial analyses will be performed by technical experts), explain what the results mean and appropriately apply in decision making
- Use the project managers' tool box, interactive flow charts for choosing geospatial methods and review checklist to use geospatial analyses confidently in decision making

ITRC (Interstate Technology and Regulatory Council) [www.itrcweb.org](http://www.itrcweb.org)

Training Co-Sponsored by: US EPA Technology Innovation and Field Services Division (TIFSD) ([www.clu-in.org](http://www.clu-in.org))

## Housekeeping

- ▶ Course time is 2¼ hours
- ▶ This event is being recorded
- ▶ Trainers control slides
  - Want to control your own slides? You can download presentation file on Clu-in training page
- ▶ Questions and feedback
  - Throughout training: type in the "Q & A" box
  - At Q&A breaks: unmute your phone with #6 to ask out loud
  - At end of class: Feedback form available from last slide
    - Need confirmation of your participation today? Fill out the feedback form and check box for confirmation email and certificate

Copyright 2016 Interstate Technology & Regulatory Council,  
50 F Street, NW, Suite 350, Washington, DC 20001

Although I'm sure that some of you are familiar with these rules from previous CLU-IN events, let's run through them quickly for our new participants.

We have started the seminar with all phone lines muted to prevent background noise. Please keep your phone lines muted during the seminar to minimize disruption and background noise. During the question and answer break, press #6 to unmute your lines to ask a question (note: \*6 to mute again). Also, please do NOT put this call on hold as this may bring unwanted background music over the lines and interrupt the seminar.

Use the "Q&A" box to ask questions, make comments, or report technical problems any time. For questions and comments provided out loud, please hold until the designated Q&A breaks.

**Everyone** – please complete the feedback form before you leave the training website. Link to feedback form is available on last slide.

## ITRC ([www.itrcweb.org](http://www.itrcweb.org)) – Shaping the Future of Regulatory Acceptance

The Interstate Technology and Regulatory Council (ITRC) is a state-led coalition of regulators, industry experts, citizen stakeholders, academia and federal partners that work to achieve regulatory acceptance of environmental technologies and innovative approaches. ITRC consists of all 50 states (and Puerto Rico and the District of Columbia) that work to break down barriers and reduce compliance costs, making it easier to use new technologies and helping states maximize resources. ITRC brings together a diverse mix of environmental experts and stakeholders from both the public and private sectors to broaden and deepen technical knowledge and advance the regulatory acceptance of environmental technologies. Together, we’re building the environmental community’s ability to expedite quality decision making while protecting human health and the environment. With our network of organizations and individuals throughout the environmental community, ITRC is a unique catalyst for dialogue between regulators and the regulated community.

For a state to be a member of ITRC their environmental agency must designate a State Point of Contact. To find out who your State POC is check out the “contacts” section at [www.itrcweb.org](http://www.itrcweb.org). Also, click on “membership” to learn how you can become a member of an ITRC Technical Team.

**Disclaimer:** This material was prepared as an account of work sponsored by an agency of the United States Government. **Dave Becker** is a geologist with the Environmental and Munitions Center of Expertise (EM CX) of the US Army Corps of Engineers (USACE) in Omaha, Nebraska. Since coming to the EM CX in 1991, Dave has been involved with providing technical consultation, teaching, review of environmental restoration-related documents, and preparation of guidance relevant to field studies and *in-situ* remediation. He has strong interests in optimization of remediation systems and long-term monitoring programs, site characterization techniques, and *in-situ* remediation technologies. Before coming to the EMCX in 1991, Dave was Chief, Geology Section at the USACE Omaha District between March 1989 and December 1990. For five years prior to becoming a supervisor, Dave was a project geologist in Omaha District actively involved in many environmental restoration projects. Dave is an active member of the ITRC Geostatistics for Remediation Optimization team and previously worked on the Remediation Risk Management and Remediation Process Optimization teams and has taught numerous Internet and live seminars for ITRC, USACE, and EPA. He is a member of the Geological Society of America, the American Geophysical Union, the American Association of Petroleum Geologists, and the Nebraska Geological Society. Dave is also an adjunct professor of geology at the University of Nebraska at Omaha where he teaches hydrogeology, geophysics, and environmental geology. Dave earned a bachelor's degree in geology from the University of Nebraska at Omaha in 1981 and a master's degree in geophysics from Southern Methodist University in Dallas, Texas in 1985. He is a registered professional geologist in Nebraska.

**Adam Janzen** is an environmental engineer with Barr Engineering Company in Minneapolis, Minnesota. His primary area of expertise is in groundwater flow modeling with typical applications of wellhead protection, mine dewatering, water supply, and contaminant fate and transport. He has used geostatistical methods to evaluate and optimize sampling networks and presented a paper describing an automated optimization approach at the MODFLOW and More 2013 conference. At Barr he has taught an internal geostatistics training course. Prior to joining Barr in 2011, Adam developed multi-phase flow models to simulate injection and geologic storage of carbon dioxide for a start-up company. Adam earned a bachelor's degree in civil and environmental engineering from the University of Illinois at Urbana-Champaign in 2008 and a master's degree in civil and environmental engineering from Princeton University in 2010. He is a licensed professional engineer in Minnesota.

**Chris Stubbs** is a senior manager with ENVIRON International Corp. in Emeryville, California. Since 2000, he has worked in environmental science and engineering, with special emphasis on groundwater hydrology and chemical fate and transport in the environment. Specific areas of expertise include groundwater modeling, statistical analysis, risk-based site assessment and remediation, exposure analysis and human health risk assessment. He has prepared evaluations of the risk from vapor intrusion into indoor air at numerous sites, including preparing expert reports and giving deposition testimony as an expert witness. He has developed regional groundwater flow and transport models to evaluate remedial alternatives and to estimate cleanup times. Chris is a member of the ITRC Groundwater Statistics and Monitoring Compliance project team. Chris earned a bachelor's degree in 1988 in physics from the University of California at Berkeley, CA. He earned a master's degree in 1996 in technology and policy, a master's degree in 1996 in environmental engineering, and a PhD in 2000 in hydrology and water resource engineering all from the Massachusetts Institute of Technology in Cambridge, MA. He is a professional civil engineer in California.

**Michael (Mike) Kwiecinski** is an environmental protection specialist since 2004 with the Colorado Division of Oil and Public Safety, located in Denver, Colorado. In an environmental protection specialist capacity, he oversees response for releases from above and underground storage tank systems, AST/UST inspections and assists with reimbursement from the Colorado Petroleum Storage Tank Fund. Since 1991, he has worked in industry, consulting and as a regulator doing geological and environmental assessment and remediation. He has contributed to ITRC's Petroleum Vapor Intrusion, Geostatistics for Remediation Optimization and Total Petroleum Hydrocarbon Risk Guidances, and has authored regulations and guidance. He earned a bachelor's degree in geology, with an emphasis on hydrogeology, from the University of Michigan in Arbor, Michigan in 1993, and is a licensed Professional Geoscientist with the State of Texas.

## Presentation Overview

- ▶ **Introduction**

- ▶ Putting GRO into Practice

Optimization  
Questions

Methods

Software

PM's  
Tool Box

Work Flow

Choosing  
Methods

## Geospatial Analysis for Optimization at Environmental Sites (GRO-1)

- ▶ If you use/view computer-generated contour maps, you've used geospatial methods!
- ▶ Computer-based tools to contour data are spatial tools
  - Groundwater contours
  - Concentration contours/plume maps
  - Surface elevations (including elevation of geologic features)

ITRC GRO-1, Figure 19

## Geospatial Analysis for Optimization at Environmental Sites (GRO-1)

- ▶ We are being asked to do more with less
- ▶ Agencies/Department of Defense have policies requiring optimization
  - Some focus on post construction
  - Others promote optimization throughout life cycle
- ▶ [ITRC Remediation Process Optimization guidance documents and fact sheets](#)
- ▶ Other tools
  - Federal Remediation Technology Roundtable ([FRTR](#))
  - EPA [Clu-in web sites](#) have references, case studies
  - US Air Force tools

ITRC GRO-1, [History of Remedial Process Optimization](#)

## Why This Matters: Geospatial Tools Optimize Our Work

► Geospatial methods **helpful to optimize** activities

- Optimization = effort (at any clean-up phase) to identify & implement actions that improve effectiveness & cost-efficiency of that phase

► Example: Geospatial analysis help optimize monitoring networks

- Eliminating < 30 wells has small impact on map error
- Greater reductions = more error
- Compare plume maps with & without the eliminated wells

ITRC GRO-1, Figure 52, Example 1:  
Sampling Redundancy Analysis in  
Visual Sample Plan (VSP)

## Why This Matters: Geospatial Methods Help You...

- ▶ Achieve cost saving for the total project life cycle
  - Improved planning
  - Optimization of scope for characterization and monitoring
  - Demonstration of attainment of goals
- ▶ Conduct enhanced data evaluation/interpretation
  - Improved quality of data
  - Identification of trends and patterns in data
  - More accurate estimates of important quantities (average concentrations, volumes)
  - Better decision making
- ▶ Effectively communicate (with your peers, the public)
  - Data visualizations

Dave Becker, USACE

## Why This Matters: Geospatial Tools Aid Interpretation

- ▶ Geospatial analysis helps understand relationships between observed contamination and sources
- ▶ Example: The figures show relationship between metal contamination and a river that periodically floods

## Why This Matters: Geospatial Methods Help Communication

- ▶ Visualization tools depend on geospatial methods to generate 2-D & 3-D information to present graphically
- ▶ Example: Material identified for excavation at a site

ITRC GRO-1, Figure 100. Oblique view of the site highlighting material identified for excavation (vertical exaggeration 5x horizontal).

## Poll Question

---

- ▶ What role would you likely play in application of geospatial analysis?
  - Project manager overseeing team members who conduct the analysis
  - Technical reviewer of geospatial analysis
  - Technical practitioner applying the methods
  - Stakeholder interested in understanding basis and meaning of the results of geospatial analyses
  - Others

## ITRC GRO Guidance is an Interactive Resource for Various Users and Includes...

- ▶ Fact sheets
- ▶ Summary and comparison information on software
- ▶ Project manager's tool box
- ▶ Review checklist
- ▶ Flow charts

<http://www.itrcweb.org/gro-1>

## Training and Guidance Objectives:

**Learning objectives:** With the ITRC Geospatial Analysis for Optimization guidance document and this associated training, project managers/technical staff will be able to:

- ▶ **Determine if appropriate** - based on available data & site needs, determine if geospatial analyses are appropriate for site
- ▶ **Identify questions** - for project and specific lifecycle stage, identify optimization questions to ask
- ▶ **Select method(s)** - select appropriate geospatial method(s) and software to answer questions
- ▶ **Explain and apply results** - explain what the results mean and appropriately apply in decision making

*NOTE! Training is meant primarily to give you a taste of the critical concepts and provide overview of the guidance.*

## Presentation Overview

Work Flow

Choosing Methods

## Geospatial Analysis Work Flow

- ▶ Review conceptual site model (CSM) and project goals
  - ▶ Perform exploratory data analysis
  - ▶ Choose geospatial method
  - ▶ Build model / check model
  - ▶ Generate results (predictions and uncertainty)
- See [Flow Charts](#)
- See [Review Checklist](#)

# ITRC GRO-1 Flow Charts

[ITRC GRO-1, Choosing Methods](#)

## Applications of Geospatial Methods

---

- ▶ What are the data requirements?
- ▶ Regulatory barriers and concerns – Fact Sheet 1
- ▶ What are the common misapplications?
- ▶ Using geospatial methods to support optimization
  - Optimization questions one may ask at various project phases for which geospatial methods can be used

## Regulatory Barriers and Concerns

- ▶ Many state and federal agencies have accepted approaches for optimization
- ▶ Guidelines vary by agency – user should identify before proceeding
- ▶ Modification of project life-cycle activities can be difficult from a regulatory perspective
- ▶ Hesitance to use or accept new geospatial analysis
  
- ▶ ***POLL QUESTION: Have you experienced resistance to using geospatial methods for a project?***

## What are the Common Misapplications?

- ▶ Common Misapplications include a list of common misapplications & recommendations to avoid them.

Examples:

- Inadequate amount of data
- Extrapolation of data
- Geospatial models inadequately addressing heterogeneity
- Ignoring impact of censored data
- Not accounting for data uncertainty

- ▶ Common misapplications – *more info to come in subsequent slides*

ITRC GRO-1, Figure 22  
Water levels near a fault

## Optimization Questions – Examples for Different Project Phases

- ▶ Release Detection:
  - Do the detected concentrations represent an actual plume?
  - Note there is often only spatially sparse data at this phase
- ▶ Site Characterization:
  - What is appropriate sample spacing, considering spatial correlation?
- ▶ Remediation:
  - What are the estimated average concentrations (for treatment design)?
- ▶ Monitoring
  - How can geospatial methods help optimize a monitoring program?
- ▶ Closure
  - Can geospatial methods help determine if the monitoring program is adequate for closure?
  - Note that spatial data are often sparse near closure

## Example of Life-Cycle Optimization Question & Geospatial Methods to Apply

- ▶ Site characterization phase – “What is appropriate sample spacing, considering spatial correlation?”
  - Planning for cost-effective sampling: choosing sampling spacing to characterize soil contamination
  - Use geospatial analyses to estimate sample spacing to avoid duplication of information (spatial correlation)
  - Construct variogram (will be discussed in more detail), determine geostatistical range, use as basis for sample spacing with independent data
  - Software to do this can be located using guidance

ITRC GRO-1, [Site Characterization](#)

## Where to Next? Answering the Questions

---

- ▶ Geospatial methods are identified that may answer these questions and are generally categorized into:
  - Simple
  - More complex
  - Advanced
- ▶ Software tools are identified to apply the proposed methods

## Poll Question

---

- ▶ Based on what we've presented in this section, do you work on sites that could benefit from geospatial analysis?
  - Yes
  - No, not enough data
  - No, we don't need geospatial analysis
  - Don't know yet

## Presentation Overview

- ▶ Introduction
- ▶ Opportunities to Apply Geospatial Analyses
- ▶ **Fundamentals of Geospatial Methods**
- ▶ How to Apply and Application Examples
- ▶ Putting GRO into Practice

Optimization Questions

Methods

PM's Tool Box

Work Flow

Choosing Methods

## After Fundamentals Section, You Can...

---

- ▶ Explain how geospatial methods work
  - Classification and components
  - Variograms – key concept for geospatial analysis
- ▶ Avoid misapplications

## Basic Premise of Geospatial Methods

- ▶ Tobler's First Law of Geography (Tobler 1970):  
*"Everything is related to everything else, but near things are more related than distant things."*
- ▶ Sample observations collected close together in space or time are more related than sample observations collected farther apart.
- ▶ This is the basic premise of geospatial methods

ITRC GRO-1, [Fundamental Concepts](#)

Tobler, W. 1970. "A Computer Movie Simulating Urban Growth in the Detroit Region." *Economic Geography* 46 (2):234-240.

# Spatial Correlation Illustrated

Classical Statistics  
Realm

No Spatial Correlation

Geospatial Method  
Realm

Systematic Variation  
(Trend)

Bounded Spatially-  
Correlated Variation  
(Autocorrelation)

ITRC GRO-1, Figures 8, 9 and 10

## Trend and Autocorrelation Together

- ▶ Trend: Blue line
- ▶ Autocorrelation: Deviation from trend

## Geospatial Model Components

### Geospatial Model = Trend + Error + Autocorrelation

- ▶ Trend: Large-scale variation (e.g., regional)
  - All methods (simple, more complex, advanced)
- ▶ Error: Measurement error and micro-scale variation
  - More complex and advanced methods
- ▶ Autocorrelation: Small-scale variation around the trend
  - Advanced methods only

## Geospatial Method Classification

- ▶ Simple (trend)
  - Inverse distance weighting, natural neighbor, Voronoi Diagrams/Thiessen Polygons, Delaunay Triangulation
- ▶ More complex (trend + error)
  - Regression-type methods, splines
  - Focus on modeling the trend component with secondary data (predictor variables)
- ▶ Advanced (trend + autocorrelation + error)
  - Kriging or geostatistical-type methods
  - Trend component is usually simple
  - Focus on modeling the autocorrelation component

## Simple Methods for Maps, More Complex or Advanced for Optimization

- ▶ Simple methods focus on making good maps
  - “Good” is typically evaluated visually
  - Map should be consistent with CSM
- ▶ Many optimization tasks require more than just mapping.
  - More complex and advanced methods are based on statistical modeling
  - They produce more accurate predictions with estimates of uncertainty

**More complex and advanced methods can also be “simple” methods when using default parameters. This is acceptable for mapping ONLY.**

## Why Is Spatial Correlation Important?

---

- ▶ Good news: spatial correlation allows mapping between samples!
  - Used by all methods to interpolate between sample locations
- ▶ Bad news: correlated samples reduce uncertainty less than independent samples
  - Need to understand correlation scale to optimize sampling
  - Sample spacing  $\ll$  correlation scale do not provide much additional information

## Quantifying Spatial Correlation with Variograms

- ▶ The variogram (or semivariogram) quantifies spatial correlation
- ▶ The variogram is a plot of the squared differences between measured values as a function of distance between sampling locations
- ▶ Kriging requires a variogram (autocorrelation model)
- ▶ Variogram is also useful by itself to identify the scale of spatial correlation

## Variogram Terminology

- Directionality is important when constructing the variogram
  - 2D vs 3D problems

# The Three General Variogram Cases

No Spatial Correlation

Trend

Autocorrelation

ITRC GRO-1, Figures 8, 9 and 10

## Variogram Pop Quiz

► What are the range and sill of this variogram?

- A) Range = 60, Sill = 10
- B) Range = 9, Sill = 24
- C) Range = 24, Sill = 9
- D) Sill = 60, Range = 10

## And the answer is...

► C) Range = 24, Sill = 9

- Sill is theoretically the variance of the data
- Range is the scale of spatial correlation; has implications for sample spacing

## 65% Reduction in Total Number of Samples for Comparable Delineation – Case Study

- ▶ More information in [GRO-1 Case Study: Optimization of Sediment Sampling at a Tidally Influenced Site](#)
- ▶ Delineate area of sediment with PCB concentrations above a risk-based threshold
- ▶ Retrospective geospatial analysis used variography and kriging to optimize the sampling approach

	# sediment samples
Initial sampling 2001-2002	240
Actual, additional samples collected from 2003-2008	509
If choice of 2003-2008 sample locations had been guided by the range of the 2001-2002 variogram	24

## Choice of Method Affects Mapping

ITRC GRO-1, Figure 15; Figure Source: (Kresic and Mikszewski 2012)

Figure Source: Kresic, N., and A. Mikszewski. 2012. Hydrogeological Conceptual Site Models: Data Analysis and Visualization. Boca Raton, FL: CRC Press. <https://www.crcpress.com/Hydrogeological-Conceptual-Site-Models-Data-Analysis-and-Visualization/Kresic-Mikszewski/p/book/9781439852224>

Orange: S simple methods

Green: MC more complex methods

Blue: A advanced methods

## Search Neighborhood Radius Impacts Map Smoothness

- ▶ Kriging and inverse distance weighting estimate values at unsampled locations using a weighted sum of nearby data points
- ▶ Value of search neighborhood radius affects smoothness of final map:

ITRC GRO-1, Figure 18

## Exact vs. Inexact Interpolation Affects Perceived Map Accuracy

- ▶ Exact interpolation: predictions exactly match measured values at measurement locations
- ▶ Most simple methods are exact interpolators
- ▶ Kriging can be an inexact interpolator – incorporates error
  - Locational error
  - Lab and field sample error
    - Duplicate samples?

**Issue: People Like Contours with Exact Interpolation**

ITRC GRO-1, Figure 19

## Boundary Omission Leads to Misapplication

- ▶ Surface water features, concentration source zones, impermeable boundaries (slurry walls), faults
- ▶ Rely on conceptual site model
- ▶ Failure to incorporate can result in misapplication

ITRC GRO-1, Figure 21

## Fundamentals Section Wrap Up

---

- ▶ Data must show spatial correlation in order to use geospatial methods
- ▶ Geospatial model = Trend + Error + Autocorrelation
- ▶ Variograms quantify spatial correlation and are a key concept in geospatial analysis
- ▶ Choose a geospatial method consistent with your CSM

# Question & Answer Break

## Presentation Overview

- ▶ Introduction
- ▶ Opportunities to Apply Geospatial Analyses
- ▶ Fundamentals of Geospatial Methods
- ▶ **How to Apply and Application Examples**
- ▶ Putting GRO into Practice

Optimization Questions

Methods

Software

PM's Tool Box

Work Flow

Choosing Methods

## How to Apply and Application Examples -- Outline

- ▶ Modeling the data for optimization
  - Geospatial analysis work flow
  - Quantifying uncertainty
- ▶ How to apply more complex methods
  - Exploratory data analysis (EDA)
  - Nonparametric regression
- ▶ How to apply advanced methods
  - Kriging
  - Model evaluation
  - Conditional simulation
  - Cokriging

## Modeling the Data for Optimization

---

- ▶ Quantitative predictions for optimization require *modeling* the data with more complex or advanced methods
  - Predictions are more accurate
  - Uncertainty in predictions can be quantified
  - Sampling can be better optimized
- ▶ Modeling goes beyond mapping the data
  - Fit statistical model to the data
  - Assess accuracy of predictions

ITRC GRO-1, [More Complex Methods](#), [Advanced Methods](#)

## Follow the Geospatial Work Flow

---

### ▶ Practitioners

- Conduct the geospatial analysis
- Follow the work flow to model the data
- Document each step of work flow

### ▶ Reviewers

- Review the geospatial analysis
- Follow the work flow to check that model is appropriate
- Verify that documentation includes each step of work flow

## Geospatial Analysis Work Flow

- ▶ Review CSM and project goals
  - Identify key site features and questions
- ▶ Perform exploratory data analysis
  - Evaluate distribution, outliers, trend, spatial correlation, auxiliary data
- ▶ Choose geospatial method
  - Simple, more complex, advanced
- ▶ Build model / check model
  - Cross-validation and CSM consistency
- ▶ Generate results (predictions and uncertainty)

## Measures of Uncertainty

---

- ▶ Standard error and variance
  - Output of more complex and advanced methods
- ▶ Confidence/prediction interval
  - Can be calculated from predictions and standard error or variance
- ▶ Exceedance probability
  - Probability of exceeding a threshold

ITRC GRO-1, [Evaluate Accuracy](#), [Generate Results](#)

## Measures of Uncertainty

### Data

## Measures of Uncertainty

### Data + Model

## Measures of Uncertainty

### Data + Model + Standard Error

## Measures of Uncertainty

### Data + Model + 95% Confidence Interval

## More Complex Methods Example

### Soil Samples Near River Meuse

Zinc Concentration (ppm)

- 100
- 200
- 500
- 1000
- 2000

CSM: Flooding of River Meuse causes elevated zinc in floodplain

ITRC GRO-1, Figure 61

## What are Optimization Questions?

---

- ▶ Optimization questions
  - What is 95% upper confidence level (UCL) of mean zinc concentration?
  - How can secondary (proxy) data be used to improve predictions of mean zinc concentration?

# EDA: Normalize Zinc Distribution

ITRC GRO-1, Figure 62

# EDA: Zinc Autocorrelation

ITRC GRO-1, Figure 64

# EDA: Zinc vs. Distance to River

ITRC GRO-1, Figure 65

## EDA: Zinc vs. Soil Type

*Categorical variables can only take one of a fixed number of values*

ITRC GRO-1, Figures 67, 68

## When to Use More Complex Methods

### ► Description

- Regression methods with no spatial correlation model
- Very flexible (e.g. can incorporate features such as faults)
- Works best when other predictor variables are available
- Assumes regression residuals are spatially uncorrelated and normally distributed (after transformation)
- Provides prediction standard error or variance

### ► Methods

- Parametric regression
- Splines and kernel smoothing
- Nonparametric regression

ITRC GRO-1, [More Complex Methods](#)

# Nonparametric Regression Can Model Complex Data

Parametric

ITRC GRO-1, Figure 29

Nonparametric

ITRC GRO-1, Figure 27

## Select Method (More Complex)

---

- ▶ Nonparametric regression selected due to availability of secondary data
- ▶ Final model based on:
  - Distance to river
  - Soil type
  - Flood frequency
  - Smooth fit (thin-plate spline) of trend
- ▶ Best predictors selected using model evaluation techniques (cross validation)

# Predictions and Standard Error

Predicted Log Zinc Concentrations

Prediction Standard Error

ITRC GRO-1, Figures 73, 74

## Check Residuals for Autocorrelation

Regression assumes no autocorrelation of residuals

## Use Model for Optimization

---

- ▶ Calculate average concentration with confidence limits to compare to remediation target concentration
- ▶ Optimize sampling/remediation
  - Locate additional samples at locations with highest uncertainty
  - Select subareas to target for remediation in order to reduce upper confidence limit below remediation target

## Advanced Methods Example

### Soil Samples Near River Meuse

Zinc Concentration (ppm)

- 100
- 200
- 500
- 1000
- 2000

CSM: Flooding of River Meuse causes elevated zinc in floodplain

ITRC GRO-1, Figure 61

## Advanced Methods Example

---

- ▶ Same CSM and zinc data as Example 1, but no secondary data available
- ▶ Optimization questions
  - What is the area requiring remediation?
  - Where should additional samples be located?

ITRC GRO-1, [Table 2](#)

## When to Apply Advanced Methods

### ► Description

- Extension of regression methods including a spatial correlation model
- Works best when sufficient data to estimate correlation model are available
- Assumes residuals after trend removal are stationary and normally distributed (after transformation)
- Provides prediction standard error or variance

### ► Methods

- Kriging/Cokriging (point and block)
- Conditional simulation

ITRC GRO-1, [Advanced Methods](#)

## Advanced Methods Require Variography

- ▶ A variogram model is fit to model autocorrelation.  
Most common choices:

ITRC GRO-1, Figure 79

## Quiz: Selecting Variogram Model

- What variogram function(s) could be used?

# Answer: Selecting Variogram Model

## Variography of Meuse Data

- Fit variogram using exponential model

ITRC GRO-1, Figure 44

## Remove Trend When Variogram Unbounded

When data has trend (non-stationary), variogram is unbounded.  
→ Remove trend and use variogram of residuals

ITRC GRO-1, Figure 32, 34

## Selecting Method: Kriging Types

Name	Trend Model
Simple Kriging	Constant (known, usually zero)
Ordinary Kriging	Constant (unknown)
Universal Kriging	Polynomial function of coordinates
Kriging with External Drift	Regression on secondary data (simultaneous)
Regression Kriging	Regression on secondary data (sequential)

Use ordinary kriging unless there is a strong trend in the data with a physical basis

# Kriging of Zinc Concentration

Ordinary Kriging  
(Spherical Variogram)

Ordinary Kriging  
(Exponential Variogram)

## Model Evaluation

---

- ▶ Evaluate consistency of predictions with CSM
- ▶ Verify assumptions of method
- ▶ Use cross-validation to quantitatively evaluate model quality
  - Can be used with any method
  - Take one out cross validation is most common
  - Look at accuracy of predictions and accuracy of prediction standard errors

## Compare Models Using Cross-Validation

- ▶ Inverse distance weighting (IDW) added for comparison to ordinary kriging (OK)
- ▶ All methods smooth the data

ITRC GRO-1, Figure 47

## Use Cross-Validation to Check Model Accuracy

- ▶ Evaluate prediction accuracy using:
  - Mean Error: average of cross-validation errors (should be close to 0)
  - Root Mean Square (RMS) Error: square root of the average squared cross-validation errors (should be close to 0)

Method	Cross Validation Statistics				
	Variogram	Mean Error	Root Mean Square Error	Mean Standardized Error	Root Mean Square Standardized Error
Inverse Distance Weighting	NA	-0.0128	0.514	NA	NA
Ordinary Kriging	Exponential	0.00213	0.393	0.00301	0.93
Ordinary Kriging	Spherical	-2.06E-05	0.392	0.00017	0.90

ITRC GRO-1, Table 4

## Use Cross-Validation to Check Model Accuracy

- ▶ Evaluate accuracy of prediction uncertainty with:
  - Mean Standardized Error: mean error divided by standard error (should be close to 0)
  - RMS Standardized Error: RMS error divided by standard error (should be close to 1)

Reviewers: Was summary of cross-validation provided?

Method	Cross Validation Statistics				
	Variogram	Mean Error	Root Mean Square Error	Mean Standardized Error	Root Mean Square Standardized Error
Inverse Distance Weighting	NA	-0.0128	0.514	NA	NA
Ordinary Kriging	Exponential	0.00213	0.393	0.00301	0.93
Ordinary Kriging	Spherical	-2.06E-05	0.392	0.00017	0.90

ITRC GRO-1, Table 4

# Log Zinc Point Kriging Results

Predictions

Prediction Standard Error

# 95% Upper Confidence Limit

# Log Zinc Block Kriging Results

Predictions

Prediction Standard Error

## Prediction vs Simulation

- ▶ Predictions from regression and kriging are smoothed estimates of reality (expected values)
- ▶ Simulation can provide more realistic depiction of variability

## Simulation of Log Zinc

Each simulation is consistent with data and variogram

Repeat ~1,000 times

ITRC GRO-1, [Conditional Simulation](#)

# Uncertainty in Area Above Cleanup Level (1,000 mg/kg)

## Cokriging Application

Coarse Direct Sampling

High Resolution Geophysics

Landrum, C. 2013. "Mapping and decomposing scale-dependent soil moisture variability within an inner bluegrass landscape.", Theses and Dissertations, Plant and Soil Science, University of Kentucky (Paper 34).

## More Complex/Advanced Methods: Questions for Reviewers

- ▶ Is the method selected clearly described, along with a description of how it was implemented?
- ▶ Why was this method selected over alternative methods? Are the assumptions of the method met?
- ▶ How were the method parameters fit, and how was goodness-of-fit evaluated?
- ▶ Was prediction uncertainty described and quantified using cross-validation?
- ▶ Are the results consistent with the CSM?

## Welcome

### Geospatial Analysis for Optimization at Environmental Sites

Geospatial analysis supports optimization activities throughout all stages of an environmental site by:

- improving performance of characterization and remediation activities;
- increasing monitoring efficiency; and
- justifying decisions at environmental sites.

This guidance illustrates the practical application of geospatial analyses to support optimization activities, and serves as a companion to *Discharge, Statistics for Monitoring and Compliance, Statistical Tools for the Project Life Cycle (DSM-1)*. If you are visiting this site for the first time, please review the *Overview* of this guidance. All users may find the *Navigating This Website* page helpful.

# Fact Sheets – How to Use the Guidance

**Geospatial Analysis for Optimization at Environmental Sites** [HOME](#)

## Fact Sheets

These four fact sheets were developed to provide an overview to project managers, program or financial managers, stakeholders, and others about the value and use of **geospatial analysis** in optimization activities. If you are not a statistician, you can begin to understand geospatial analysis by reviewing these fact sheets. The fact sheets also provide connections to the more detailed material elsewhere in the guidance.

-  [Fact Sheet 1: How Geospatial Methods Support Optimization Activities During Environmental Project Life Cycle Stages](#)
-  [Fact Sheet 2: Site Conditions and Data Requirements for Using Geospatial Methods](#)
-  [Fact Sheet 3: Overview of Select Geospatial Methods](#)

Optimization Questions

## Geospatial Analysis for Optimization at Environmental Sites HOME

### Fact Sheet 1: Do You Need Geospatial Analysis?

This is the first of four fact sheets developed by ITRC to go along with the new ITRC guidance (GRO-1). It introduces the value and use of **geospatial analysis** to support optimization activities to project managers, program or financial managers, and stakeholders. The GRO-1 defines geospatial analysis as the process of compiling and analyzing data that are related in time or space.

#### How Geospatial Methods Support Optimization Activities During Environmental Project Life Cycle Stages?

The guidance defines optimization and identifies the questions to be answered, as well as determining whether site conditions are suitable to use geospatial analysis (See [Fact Sheet #2](#)). Depending on site-specific conditions and the regulatory framework, geospatial analysis can support optimization activities in any stage of the project life cycle. The minimum data for a viable geospatial analysis are different and usually more stringent than those for other data analyses. If the site data meets minimum data criteria (see [Section 7.1 Preliminary Requirements for Geospatial Analysis](#)), then appropriate **geospatial methods** can be selected. Numerous software packages are available to aid in applying these methods.

#### What is Optimization?

USEPA has published the National Strategy to Expand Superfund Optimization Practices from Site Assessment to Site Completion ([USEPA 2012a](#)), which describes how regulators can develop and track remedial optimization programs. In this document, USEPA defines optimization as

*efforts at any phase of the removal or remedial response to identify and implement specific actions that improve the effectiveness and cost efficiency of that phase. Such actions may also improve the remedy's protectiveness and long-*

### Common Misapplications of Geospatial Analysis

Misuses of **geospatial methods** frequently appear in professional practice. Listed below are common misapplications of these methods and appropriate alternatives to the erroneous practices. The problems and errors below can occur during all life cycle phases and are grouped by four general topic areas: CSM, EDA, model use, and model assumptions.

Additional Information

Three tables ([Tables 7 through 9](#)) are available as a downloadable Excel workbook. These tables provide information about the individual software packages in a spreadsheet format for ease of comparison. These tables can help to identify appropriate software based on a series of screening criteria, such as optimization questions, products (outputs), operating system, costs, and [geospatial methods](#).

- Table 7 lists [optimization questions](#) and whether the software is helpful for answering these questions. For each question, if the software does not include any of the methods to address the question, then a "no" symbol is shown. Some software includes the methods, but is not specifically designed to directly answer questions for example, for sample spacing, hot spot detection, or monitoring program optimization. If the software includes the methods, but additional effort is required to answer the question, then a "qualified yes" symbol is shown. If the software is specifically designed to answer the optimization question, then a "yes" symbol is shown.
- Table 8 lists key information such as the costs, required operating systems, the products supplied by the software, the formats used for data input (importing options), and data output (exporting options). This table includes software outputs based on geospatial methods, such as internal maps and graphs, contouring ability, and animation.
- Table 9 lists the geospatial [methods](#) and describes which ones are available in each software package. The methods are clustered by subject: EDA basics, simple methods, more complex methods, advanced methods, and uncertainty analysis.

[Tables 7 – 9](#) are available as a downloadable Excel workbook

## Geospatial Analysis for Optimization at Environmental Sites

### Using Analysis Results for Optimization

Geospatial methods can be used to guide sampling plan design, determine the extent of a groundwater plume, understand trends, identify redundant sampling points, and aid in a number of other approaches to optimizing remediation efforts. This section includes descriptions of using geospatial results to support different optimization activities and also some examples. Several examples in this section, (as well as longer [case studies](#) elsewhere in this guidance) illustrate how **geospatial methods** are used at various stages in the project life cycle. Often, more than one geospatial method is appropriate; for example, an analysis might start with **EDA** and **simple methods**, then progress to **more complex** or **advanced** methods. The method selection [flow charts](#) can be used to assist in determining applicable methods for a site.

Table 5 below summarizes certain general topics that **geospatial analysis** can support in each stage of the project life cycle.

**Table 5 Using Geospatial Results for Optimization**

General Topic	Life Cycle Stage
<a href="#">Plume Intensity and Extent</a>	Release Detection, Site Characterization, Monitoring
<a href="#">Trend Maps</a>	Release Detection, Remediation, Monitoring, Closure
<a href="#">Estimating Quantities</a>	All Stages
<a href="#">Hot Spot Detection</a>	Release Detection, Site Characterization
<a href="#">Sample Spacing</a>	Site Characterization
<a href="#">Estimating Concentrations Based on Proxy Data</a>	Site Characterization
<a href="#">Background Estimation</a>	Site Characterization
<a href="#">Quantifying Uncertainty</a>	Site Characterization, Closure
<a href="#">Remedial Action Optimization</a>	Remediation
<a href="#">Monitoring Program Optimization</a>	Monitoring, Closure

The examples illustrate how geospatial analysis is performed for optimization.

# Plume Shrinkage Example

## Wrap-Up: Geospatial Analyses

---

- ▶ Geospatial analyses optimize our work, facilitate interpretation/communication
- ▶ The guidance and training mean to encourage proper use of geospatial analyses
- ▶ Geospatial analyses help optimize actions throughout the project life cycle
- ▶ The data must exhibit spatial correlation in order to use geospatial methods
- ▶ All geospatial methods can be used to make maps, but only the more complex or advanced methods can provide estimates of uncertainty

## Data Interpolation is Method Dependent!

ITRC GRO-1, Figure 15, Source: ([Kresic and Mikszewski 2012](#))

Figure Source: Kresic, N., and A. Mikszewski. 2012. Hydrogeological Conceptual Site Models: Data Analysis and Visualization. Boca Raton, FL: CRC Press. <https://www.crcpress.com/Hydrogeological-Conceptual-Site-Models-Data-Analysis-and-Visualization/Kresic-Mikszewski/p/book/9781439852224>

# Other Guidance Uses

- ▶ Estimating average concentrations
- ▶ Calculating contaminant mass
- ▶ Sample spacing
- ▶ Evaluating source strength and geometry
- ▶ Not just contaminant concentrations!

The screenshot shows a website interface with a navigation menu on the left and a main content area on the right. The navigation menu includes links for 'Sample Spacing', 'Estimating Concentrations Based on Plug Zone', 'Background Research', 'Quantifying Uncertainty', 'Remedial Action Optimization', 'Monitoring Program Optimization', 'Methods', 'Software', 'Case Studies', and 'Stakeholder Perspectives'. The main content area features several sections, each with a 'HOME' button:

- Geospatial Analysis for Optimization at Environmental Sites**: Estimating Quantities. The general topics of Estimating Average Concentrations and Plume Change/Attenuation Over Time are related to Estimating Quantities.
- Geospatial Analysis for Optimization at Environmental Sites**: Plume Intensity and Extent. The general topics of Plume Intensity, Geospatial, and Contaminant Plume are related to Plume Intensity and Extent.
- Geospatial Analysis for Optimization at Environmental Sites**: Sample Spacing. Geospatial analysis can be used to guide the selection of sample locations for a remediation design. The first step is to conduct...
- Geospatial Analysis for Optimization at Environmental Sites**: Remedial Action Optimization. The general topics of Evaluating Remedial Success and Future Data Prediction/Verification are related to Remedial Action Optimization (see General Topics, Table 2). The results of geospatial interpolation can be used to directly to help optimize remedial programs or as input into other analytical tools, such as groundwater flow and contaminant fate and transport models. This approach includes using geospatial methods to support the feasibility study, remedial design, and remedy implementation. This approach also includes evaluating remedial progress/success, remedy modifications, and remedy completion status.

**Understanding the Results:** [Read More](#)

The results of geospatial interpolation can be used to optimize the following remedial program tasks:

- Delineate the target treatment zone, which can be represented by a soil or groundwater concentration contour line equivalent to the cleanup goal, or contour lines representing the presence of mobile nonaqueous phase liquid (NAPL). The target treatment zone should be represented in three dimensions, and the geospatial method and software to be used selected accordingly. (For example, perform interpolation of distinct vertical intervals and combine, or use 3D interpolation in sophisticated software such as EVSIMS or Ista3d).
- Select the optimal remedial technology considering geospatial factors such as: depth to groundwater and groundwater flux, stratigraphic elevations, contaminant concentrations, and total mass. These parameters can be interpolated using simple, more complex, or advanced methods to assist remedy selection. For example, technologies such as excavation...

### The benefits that ITRC offers to state regulators and technology developers, vendors, and consultants include:

- ✓ Helping regulators build their knowledge base and raise their confidence about new environmental technologies
- ✓ Helping regulators save time and money when evaluating environmental technologies
- ✓ Guiding technology developers in the collection of performance data to satisfy the requirements of multiple states
- ✓ Helping technology vendors avoid the time and expense of conducting duplicative and costly demonstrations
- ✓ Providing a reliable network among members of the environmental community to focus on innovative environmental technologies

### How you can get involved with ITRC:

- ✓ Join an ITRC Team – with just 10% of your time you can have a positive impact on the regulatory process and acceptance of innovative technologies and approaches
- ✓ Sponsor ITRC's technical team and other activities
- ✓ Use ITRC products and attend training courses
- ✓ Submit proposals for new technical teams and projects
