

Small arms firing ranges are those ranges accepting 50-caliber or smaller non-exploding ammunition. The primary environmental concern is lead; however, there are other associated metals and a few organics to be considered where applicable. Range operators at military, law enforcement, commercial, and private ranges and the appropriate environmental professional who might be hired to manage a ranges' more complicated environmental issues should attend this Internet-based training on Environmental Management at Operating Outdoor Small Arms Firing Ranges (SMART-2, 2005). Government environmental professionals charged with preventing environmental impact and offering technical assistance to the community should also attend this training and refer to the guidance document whenever they encounter small arms range questions. Government environmental professional are encouraged to use the downloadable version of this training and the associated guidelines as an on-site training tool for range operators in their states and communities.

This training explains how environmental management planning at small arms firing ranges is a method for pollution prevention. The training uses a logic diagram to describe the appropriate steps an environmental professional or range manager should use to establish an operational understanding of a range and the impact it can have on the environment if left unattended. It assists the user to define the environmental characteristics at a range that, left unattended, could potentially impact the environment. It lists the appropriate questions range operators should ask when evaluating the potential for environmental impact. As any potential for impact becomes apparent, the training briefly describes a variety of new and conventional technologies and techniques (i.e., 'best management practices') available to prevent environmental impact on the range. Finally, students will be able to understand range operations and monitoring that will, when appropriately designed, enable the range to operate cost-effectively without endangering the environment or the shooting enthusiasts, law enforcement officers, the military, or the public.

This guidance is a follow-up to ITRC's Characterization and Remediation of Soils at Closed Small Arms Firing Ranges (SMART-1, 2003), which addresses the cleanup of closed ranges (the remediation of former ranges so that the locations may be suitable for some other future use). It also includes an easy-to-follow decision process for determining the best remedial alternatives for lead and lead-contaminated soils at closed ranges.

ITRC (Interstate Technology and Regulatory Council) www.itrcweb.org Training Co-Sponsored by: EPA Office of Superfund Remediation and Technology Innovation (www.clu-in.org)

ITRC Course Moderator: Mary Yelken (myelken@earthlink.net)

The Interstate Technology and Regulatory Council (ITRC) is a state-led coalition of regulators, industry experts, citizen stakeholders, academia and federal partners that work to achieve regulatory acceptance of environmental technologies and innovative approaches. ITRC consists of 45 states (and the District of Columbia) that work to break down barriers and reduce compliance costs, making it easier to use new technologies and helping states maximize resources. ITRC brings together a diverse mix of environmental experts and stakeholders from both the public and private sectors to broaden and deepen technical knowledge and advance the regulatory acceptance of environmental technologies. Together, we're building the environmental community's ability to expedite quality decision making while protecting human health and the environmental community, ITRC is a unique catalyst for dialogue between regulators and the regulated community.

For a state to be a member of ITRC their environmental agency must designate a State Point of Contact. To find out who your State POC is check out the "contacts" section at www.itrcweb.org. Also, click on "membership" to learn how you can become a member of an ITRC Technical Team.

More details and schedules are available from www.itrcweb.org under "Internetbased Training."

Mark Begley is the Executive Director of the Massachusetts Environmental Management Commission at Camp Edwards on the Massachusetts Military Reservation. He is responsible for assuring that military training at Camp Edwards is compatible with environmental protection standards. Previously, Mr. Begley was Division Director of the hazardous waste site cleanup program at the Massachusetts Department of Environmental Protection. Mr. Begley developed the Massachusetts Lead Shot Initiative and managed the program for its first six years. Mr. Begley served as co-team leader on the ITRC's Small Arms Team and has assisted in the development of several leading publications on environmental issues at shooting ranges. Mr. Begley earned a Masters Degree in Environmental Engineering from the School of Engineering at Northeastern University.

Rick Patterson is the Managing Director of the Sporting Arms and Ammunition Manufacturers' Institute Inc. (SAAMI), a standardssetting organization for the manufacturers of sporting arms and ammunition in the United States. In addition, Mr. Patterson is the Director of the Facility Development Division of the National Association of Shooting Ranges (NASR). NASR is dedicated to promoting and protecting target shooting facilities by providing leadership in information, communication and partnerships between ranges, industry and community. The program provides guidance on every aspect of developing and operating a safe and successful target shooting facility. Patterson developed and launched the Facility Development Series of guidance publications, the Rangeinfo Web Site-a comprehensive information resource for range operators and developers-the Range Video Series and the NASR 5-Star rating system. He has also developed successful partnerships with many state and federal wildlife, environmental and occupational health agencies to provide range operators and developers with guidance and resources on issues such as NEPA compliance, environmental management and employee safety. Prior to joining the NSSF team, Patterson was with Coastal-Mart, the retail motor fuel division of Coastal, a Fortune 50 petroleum refiner. He graduated from Montana State University, cum laude, with a degree in organizational and managerial communication. In his spare time Patterson is Chairman of the Roxbury Conservation Commission, a two-term elected member of the Roxbury Republican Town Committee and an avid fly-fisherman, shooter, hunter and maker of bamboo fly rods. He is a former state champion International Handgun precedent-setting Shepaug River lawsuit.

Bonnie Packer has been working as a contractor for the US Army Environmental Center (USAEC) since 1996. She supports the USAEC's Acquisition and Technology Division, where she currently manages several projects for the government: the corrosion of unexploded ordnance in soil environments; munitions residues assessment; small arms range assessments; wear tolerant vegetation for arid training environments; and evaluating perchlorate treatment technologies. Many of her prior projects focused on small arms ranges, including the development of the Range Evaluation Software Tool, the Army Sampling and Analysis Plan for small arms ranges, and demonstration of several lead treatment and management technologies at Fort Rucker, Alabama. Bonnie also participates in the ITRC's perchlorate team. Before working on Army related projects, Bonnie worked on the Department of Energy's Yucca Mountain high-level nuclear waste disposal program, doing various analyses related to the safety of the waste repository. She has a MS (1985) and PhD (1990) in Geology from University of California, Los Angeles Department of Earth and Space Sciences, where her emphasis was on stable isotope geochemistry, stratigraphy and early life.

Mike Warminsky, Technical Director and AMEC Range Program Manager, has over 23 years' experience in civil engineering, remediation, and construction. In these roles, he has extensive experience in identifying, developing, and managing multi-disciplinary range projects for Department of Defense (DoD) and law enforcement facilities, with the last 10 years dedicated to range sustainability, maintenance, and remediation. He is a licensed engineer, and holds both a BS/Civil Engineering (1981) and an MBA (1995) from Lehigh University.

⁷ This Environmental Management Approach is Supported by:

- Military
- States
- Sporting Arms and Ammunition Manufacturers' Institute
- National Shooting Sports Foundation
- ▶ U.S. EPA

States – Several states, including MA, FL and MI, are conducting outreach and providing technical assistance to shooting range managers to assist them in implementing environmental management plans.

Military - In April 2000, President Clinton signed EO 13148 "Greening the Government through Leadership in Environmental Management" that established a five-year Environmental Management System (EMS) implementation goal for all Federal Facilities. EO 13148 requires an EMS at all appropriate federal facilities by December 31, 2005. Developing and implementing an EMS is required at all Army installations. Evaluating and resolving environmental Concerns associated with small arms ranges would be subject to the installation EMS. The International Organization for Standardization developed the ISO-14001 standard to provide a set of internationally recognized criteria for EMSs. The Army has chosen to use the ISO-14001 standard as a model for implementing EMSs at Army installations.

The Army has developed The Army Training Range Aspect and Impact Methodology to support and be an integral component of the installation-wide EMS. It provides appropriate, range-specific guidance on completing the assessment of environmental aspects and impacts and provides criteria to help characterize their relative significance. The methodology ensures that the installation's EMS addresses range environmental issues while focusing on its mission priorities.

Industry - The shooting sports industry has been one of the driving forces in promoting lead management at ranges. They wrote the first book (1997) on Environmental Stewardship have partnered with environmental agencies on outreach and technology development and have ongoing programs to educate range operators. In 2003, industry leaders (NSSF, NRA) signed a statement of principles on the industry's commitment to promoting environmental stewardship/BMPs at shooting facilities.

EPA – In 2001, EPA region 2 published Best Management Practices for Lead at Outdoor Shooting Ranges. This guidance was later adopted as national guidance by the agency. The guidance promotes the use of BMPs to manage the impact of lead projectiles in the environment.

Figure 1-1 from ITRC's Environmental Management at Operating Outdoor Small Arms Firing Ranges (SMART-2, February 2005) available from the ITRC Web site (www.itrcweb.org) under "Guidance Documents" and "Small Arms Firing Ranges."

Liz briefly mentioned in her section ammunition used and site or range layout.

In order to understand your range environment you first need to understand the layout and extent of your range.

This next section will cover that area in more depth.

It is important to remember, ranges, and how they interact with the environment, are often very site specific.

¹⁴ Environmental Management Planning: Select and Implement

- Checklist for an Environmental Management Plan:
 - Document baseline site conditions (photos, maps, descriptions, test results)
 - Evaluate best management practices
 - Select alternatives
 - Schedule &
 Implementation

Establish and accept environmental stewardship principles

Understand your range environment

Delineate environmental issues

Select best management practices

Prepare and implement an environmental management plan

Monitor environmental conditions and revise plan as needed

Document implementation of plan activities

¹⁵ Environmental Management Planning: Monitoring

- Monitor and evaluate whether
 - EMP is being implemented effectively
 - Adjustments must be made to the plan to achieve the desired goals
- Evaluate effectiveness relative to baseline conditions or most recent monitoring
- Quantitative and qualitative measurements can be used

Establish and accept environmental stewardship principles

Understand your range environment

Delineate environmental issues ↓ Select best management practices

Prepare and implement an environmental management plan

Monitor environmental conditions and revise plan as needed

Document implementation of plan activities

Various states and local government have rules or ordinances controlling noise

EPA 2003 "Best Management Practices for Lead at Outdoor Shooting Ranges" (EPA-902-B-01-001 Revised March 2003 Region 2)

Table 2-1 Environmental Management at Operating Outdoor Shooting Ranges (www.itrcweb.org)	
Constituent	Comment
Lead	Primary projectile constituent
Lead Styphnate/LeadAzide	Primer constituent
Antimony	Increases hardness
Arsenic	Used to increase roundness of small shot
Tin	Increases hardness
Copper and zinc	Jacket alloy metal
Tungsten	Tungsten-nylon Ammunition
Iron	Iron tips on penetrator rounds and steel shot
Cobalt and chromium	Some military rounds
Nickel	Coating improves shot performance; an alloy in center fire ammo
PAHs (Polycyclic Aromatic Hydrocarbons)	In limestone matrix of clay targets used at shotgun ranges

Arsenic – used In the production of small shot it increases the surface tension of dropped lead, thereby improving lead shot roundness

PAHs - Appears to be bound within the limestone matrix of the target. Concentration varies, but may be as high as 1000mg/kg. Manage as solid waste.

ITRC's Environmental Management at Operating Outdoor Small Arms Firing Ranges (SMART-2, February 2005) is available from the ITRC Web site (www.itrcweb.org) under "Guidance Documents" and "Small Arms Firing Ranges."

Liz briefly mentioned in her section ammunition used and site or range layout.

In order to understand your range environment you first need to understand the layout and extent of your range.

This next section will cover that area in more depth.

It is important to remember, ranges, and how they interact with the environment, are often very site specific.

Where the range is located, its design, the fire arms and the ammunition used, and how they are used, all effect the distribution of the projectiles, be they bullets or shot from shotguns.

The solders firing in the top photo are lying down, if they were standing, after passing through the target, the bullets would ultimately end up in a different location at this range.

If there was an effective berm or mound of soil behind the targets, the bullets would end up hundreds of yards closer than they would at a range without a berm.

The fabric covered berm in the lower photo from the Olympics in Greece significantly changed the shot distribution at that event.

A hillside, trees, or a shot curtain all could similarly change the footprint of the range.

The simplest rifle or handgun range design is a static range. The shooters stay in one location and the targets are stationary in another location. In an idealized world all the bullets end up in a concentrated bullet pocket.

Change this to a more dynamic or tactical range with moving shooters and/or moving targets and you can end up with a much less concentrated bullet impact area.

The aerial photo overlay Liz used nicely illustrated what a shot distribution pattern could look like at two shotgun ranges.

Similar maps or graphics are used at ranges to help identify the potential bullet distribution area or "surface danger zone" of a rifle or pistol range.

Not all of the metals end up in the berm, elevated lead levels can be found in the area immediately in front of the shooter at rifle, pistol, and shot gun ranges.

A lateral berm is an added safety feature at some ranges, it extends the berm around the sides of the range to help capture some of the ricochets. Some bullets end up on the back side of the berm, not because the go through the berm, but because they bounce up and over the berm.

Not only can berms be found behind or to the side of the targets, they can also be in front of the targets. At the range seen in the left picture, the berm protects the mechanism on a pop up target range.

The type of ammunition, its size or caliber, the amount of powder used to project it down the barrel of the gun, the metals in the projectile, and the material the bullet impacts all play a role in bullet distribution and ultimately its interaction with the environment.

Bullets fired into sand from a handgun, as shown in the photo on the right, may remain generally in tact.

Bullets traveling at a very high rate of speed from a rifle, shot into a rocky gravel can smear on surfaces and often fragment into small pieces that provide a greater surface area to oxidation, acid rain, and erosion.

Distance to the target will effect the distribution of the projectiles and the foot print of the range you are evaluating.

A rifle shooting at a target 25 meters away will normally have a much smaller bullet impact area than a range with a target 300 meters away.

Does your range have one target or multiple targets?

Be careful of your assumptions on a range layout. Were those targets shown on the range on the right hand side of the slide always in there current location?

What other weapons systems were used at that range? It is not that unusual to find grenades at some military small arms ranges.

With many of the military ranges, you can go to any part of the country and find range designs that look very similar from base to base. But one of them may have groundwater at 100 feet below ground surface, the other may have groundwater at 3 feet. The difference can be very significant.

Add in the base lets local law enforcement use the range and now you have different firing points and different ammunition being used.

Go to a police range and the lay put can vary from one town to the next.

The rod and gun club trap range may be where the local police fire their shotguns and pistols.

Again each range is different and has to be evaluated given its uses and environmental setting.

How different can two rifle ranges be?

These two pictures show two outdoor military rifle ranges.

They could not be more different:

One range is so enclosed with baffles so much that it looks like it is indoors, it has a rain water collection system, its bullets are captured by a bullet trap, a conveyer takes the bullets to a drum.

The other has no bullet containment systems of any kind other that the native soil and groundwater.

They do both have one thing in common, neither use lead ammunition.

Time to switch from talking about bullets and let's talk about shotgun ammo. Shot is fired from a shot gun. Shot may be lead, steel, copper, tungsten or a number of other metals.

Shotgun shells often have plastic tops, like the red ones pictured on a shell box in the top left photo. They usually have a crimped top that holds in the shot. The smaller sized shot is often used for bird hunting or clay target shooting, as shown on the box.

The box often lists the specs of the ammo, such as the gauge or diameter of the shell, the size of the shot i.e., $7\frac{1}{2}$ shot, how much all of the shot weights, what it does not give is the number of pieces of shot anywhere from 1 slug to 2300 projectiles for #12 shot.

Within the shell, there is often a plastic wad that cups the shot. A polyethylene wad is pictured at the top right.

How can the number of projectiles vary by several hundred? Size. The picture in the lower right of the slide is of 4 copper slugs fired from 4 different shot shells. The picture in the lower left is of 5, #9 pellets (about 2 mm in diameter), that were fired over a skeet range. The total number of pellets in the shell were most likely somewhere around 600 pellets (lots of surface area).

Refer to Figure 2-1 in the document. ITRC's Environmental Management at Operating Outdoor Small Arms Firing Ranges (SMART-2, February 2005) is available from the ITRC Web site (www.itrcweb.org) under "Guidance Documents" and "Small Arms Firing Ranges."

This graphic is from a European manual and it is in meters, but it does a nice job in laying out approximately where materials drop on a trap range.

Un-burned powder, and shards or fragments of shot are often found in close to the shooter as are the wads.

The target fragments and targets are found out further as is the start of the shot deposition area.

The earlier photo of the Olympics and this diagram show a nice neat box to catch the empty shells, the photo above the diagram is more typical, the blues, yellows and orange colors on the ground are empty shells scattered on the ground.

Not only can the empty shells be a source of lead, they can be a slip and fall hazard and give a heavily littered appearance to a range.

Traditionally Sporting Clays are configured randomly and have not allowed for concentrated shotfall. This diagram depicts retrofitted and new range configurations concentrating the shotfall.

Refer to Figure 2-1 in the document. ITRC's Environmental Management at Operating Outdoor Small Arms Firing Ranges (SMART-2, February 2005) is available from the ITRC Web site (www.itrcweb.org) under "Guidance Documents" and "Small Arms Firing Ranges."

An individual trap range has approximately a 4 acre drop zone, with 1 ³/₄ acres per additional trap range.

The suggested overlapping of drop zones is supported by NSSF, SAAMI, and other national organizations to help reduce the footprint of a range. The overlap also makes recovery more feasible.

On skeet ranges, 680 feet is the number normally used for the maximum distance when using skeet ammo loads of # 8 or #9 shot, if # 7.5 shot is used the number can jump up to 770 feet, same as with trap.

The theoretical drop zone of a single skeet field is 14 acres according to the NSSF. About 2 acres are added for each additional skeet range.

This diagram shows three skeet ranges side by side. Not all skeet ranges are so closely aligned and have as much overlap.

The range configuration or layout is the initial roadmap where you may find your range interacting with the environment.

However it is seldom a straight road, there are often twists and turns, projectiles do not always go where they are intended to go, just go to a range when the soil is very dry and see where the dust flies up or go to a military range at night and watch where the tracers ricochet fly.

Once you know the real aerial extent of the range, you then see what other environmental receptors may be effected.

As Bonnie will cover, not everything stays put, and lastly not all ranges are ideally located to minimize their impact to the environment.

Figure 2-1, Environmental Management at Operating Outdoor Small Arms Firing Ranges, ITRC Smart-2, 2005

ITRC's Environmental Management at Operating Outdoor Small Arms Firing Ranges (SMART-2, February 2005) is available from the ITRC Web site (www.itrcweb.org) under "Guidance Documents" and "Small Arms Firing Ranges."

- Goal
 - Manage potential impacts posed by range activities on the environment, public health and/or public welfare
- Approach
 - Keep lead on-site and in its metallic form
 - "High Speed" projectiles landing off site
 - "Low Speed" erosion/dissolution
 - Prevent projectiles from impacting wetlands or surface waters
 - Reduce noise impacts to surrounding properties

When purchasing treatment additives, the range owner/manager should:

determine the credibility of the vendor,

review the application instructions to determine if the owner/manager has the capabilities to meet the requirements,

review the warranty that accompanies the additive to insure that the owner/manager protected from product failure,

require treatability study using range soil before purchasing.

ITRC's Characterization and Remediation of Soils at Closed Small Arms Firing Ranges (SMART-1, January 2003) is available from the ITRC Web site (www.itrcweb.org) under "Guidance Documents" and "Small Arms Firing Ranges."

ITRC's Characterization and Remediation of Soils at Closed Small Arms Firing Ranges (SMART-1, January 2003) is available from the ITRC Web site (www.itrcweb.org) under "Guidance Documents" and "Small Arms Firing Ranges."

Slow and divert water flow around high concentration areas

Regrade range floor to promote slower water flow if necessary

Keep berms and range floor vegetated (rhizome grasses) to prevent erosion and keep splatter pile from migrating

Amend soils on berms and range floor to promote vegetation (organic material, fertilizer, and lime)

Use 2:1 slopes or less on the berm face to discourage high rates of water movement and erosion

Compact soil in berm rather than use push and dump

Periodic removal of lead from highest concentration areas

Alternatives include

Steel

Bismuth

Tungsten alloys

Copper

Consideration for use of alternatives

Life-cycle cost

Ballistics

Health and environmental risk

Safety

Less supporting environmental product research

Ammunition ban (e.g. not publicly available)

Typical pathways for migration are overshooting, ricochet, or erosion/runoff Berms, bullet traps and baffles are all components of a containment system Containment critical for shooter/public safety

Berm are major components of outdoor rifle and pistol ranges

Berms consist of several types

Soil Berm – uses site or imported soils

Engineered Berm – Copius sand trap/Passive Reactive Berm

Granular Rubber Berm – similar to engineered berm, substituting granular rubber for sand

Managed for both safety and environmental stewardship

Periodic restoration to original dimensions and removal of the projectiles

Soil amendments

Reducing the contact between water and projectiles

Your feedback is important – please fill out the form at:

http://www.clu-in.org/conf/itrc/smartemp

The benefits that ITRC offers to state regulators and technology developers, vendors, and consultants include:

Helping regulators build their knowledge base and raise their confidence about new environmental technologies

Helping regulators save time and money when evaluating environmental technologies

Guiding technology developers in the collection of performance data to satisfy the requirements of multiple states

Helping technology vendors avoid the time and expense of conducting duplicative and costly demonstrations

Providing a reliable network among members of the environmental community to focus on innovative environmental technologies

How you can get involved with ITRC:

Join an ITRC Team – with just 10% of your time you can have a positive impact on the regulatory process and acceptance of innovative technologies and approaches

Sponsor ITRC's technical team and other activities

Be an official state member by appointing a POC (State Point of Contact) to the State Engagement Team

Use ITRC products and attend training courses

Submit proposals for new technical teams and projects
