

# US EPA ORD's Engineering Issue Paper: Electrokinetic (EK)- Enhanced In Situ Remediation -- options for addressing contaminants in low- permeability (low-k) environments

ORD Technical Support Coordination Division  
Development of the EK Enhanced Remediation EIP

## Electrokinetic (EK) Enhanced *In Situ* Remediation

ENGINEERING ISSUE PAPER

Office of Research and Development  
Center for Environmental Solutions and Emergency Response  
Technical Support Coordination Division

# EPA Technical Support Project (TSP): ORD's Technical Support for Contaminated Sites

CDR David Gwisdalla, USPHS, P.E.

Director, Engineering Technical Support Center

# Presentation Overview

- EPA's Technical Support Project (TSP) Overview
- Office of Research and Development's (ORD's) role in the TSP
- Overview of ORD and its Technical Support Coordination Division (TSCD)
- How Regional offices gain access to ORD's expertise
- An Example of Relevant TSCD Technical Support – Electro Kinetic (EK) Enhanced Remediation
- TSP's Issue Papers
- Review of EK Engineering Issue Paper

## Regional Resources

- In-house technical expertise (e.g., hydrologists and risk assessors)
- Contractor support via regional contract vehicles
- Existing technical sources: Clu-In, TrainEx, NARPM, etc.

## Regional Forums

- Act as a hub for technology transfer
- Work to ensure OSCs and RPMs are updated on the most recent policy/guidance
- Active forums: Engineering, Groundwater, Federal Facilities, Contaminated Sediments
- Led by Regional RPMs

## Office of Land and Emergency Management (OLEM)

- TIFSD as a division within OLEM provides support through:
  - Environmental Response Team
  - Technology Assessment Branch
  - Technology Integration and Information Branch
  - Analytical Services Branch

## Office of Research and Development (ORD)

- Provides support through its Technical Support Coordination Division's (TSCD's)
  - Superfund and Technology Liaisons
  - Technical Support Centers

# OFFICE OF RESEARCH AND DEVELOPMENT (ORD)

Conducting critical research  
and technical support that  
informs and enables the  
safeguarding of our nation's  
public health and environment

# ORD's Labs and Offices

# ORD is Organized by Centers

Center for Computational Toxicology and Exposure (CCTE)

Center for Environmental Measurement and Modeling (CEMM)

Center for Environmental Solutions and Emergency Response (CESER)

- **CESER** is ORD's focal point for large-scale emergency response technical support coordination and technical support at Superfund sites
- **CESER's** Technical Support Coordination Division (TSCD) leads contaminated sites related technical support for ORD through its Regional Superfund Technology Liaisons (**STLs**) and Five Technical Support Centers (**TSCs**)

Center for Public Health and Environmental Assessment (CPHEA)

# Technical Support Coordination Division

TSCD facilitates the transfer of research results into the field (site characterization, modeling, monitoring, assessment, and remediation, etc.).

- **Superfund and Technical Liaisons (STLs)**, who are regionally based, work with remedial project managers, corrective action staff, and on-scene coordinators to identify available ORD resources and specialized expertise to assist with specific clean-up sites, tasks or projects.
- ORD has **five Technical Support Centers (TSCs)** that help to integrate science and technology into contaminated site clean-up activities.

# Technical Support Coordination ORD Superfund and Technology Liaisons (STLs)

**Region 10**  
[Kim Prestbo](#)

**Region 9**  
[Sarah Watson](#)

**Superfund and Technology Liaisons (STLs): Regions 1 - 10**  
**STLs coordinate contaminated-site-related technical support requests from the Regions**

# ORD's FY 2023 Technical Support Requests

**188**  
**Support Requests**

Covering direct, site-specific technical assistance; document review; engineering & prototype testing; risk assessment; research & tech transfer.

**124**  
**Site-specific Projects**

Provided direct contaminated site-specific support for Superfund, RCRA Corrective Action and Brownfields sites.

**23**  
**STLR Projects**

In collaboration with ORD STLs to support scientifically defensible decisions during site cleanup.

# Riverfront Superfund Site: PCE Treatment Alternatives

- New Haven, Missouri – On-Scene Coordinator (OSC) sought treatment options for PCE contaminated in tight clay soils in addition to other removal action options being considered.
- Electro-Kinetic (EK) enhanced technology, called EK-BIO™ was a potential option. OSC sought insights on the feasibility of its use at the site.
- **Impact:** Informed OSC's decision making – options limited; EK-BIO™ not proven for application

## How is EK Applied in the Field?

# EPA Contaminated Site Related Issue Papers

- Issue Papers are a series of technology transfer documents that summarize the latest information on selected waste treatment and site remediation technologies and related issues.
- [Link to TSP related Clean-up Issue Papers](#) by ORD and others from 1989 through 2024.

## A Sample of Issue Papers Available from EPA:

- [Electrokinetic \(EK\) Enhanced In Situ](#) (EPA-600-R-23/329)
- [HazWaste Clean-up Technical Resources](#) (EPA-542-F-09-003)
- [Conducting Climate Vulnerability Assessments at Superfund Sites](#) (EPA-542-R-23-002)
- [Ecosystem Services at Contaminated Site Cleanups](#) (EPA 542-R-17-004)

# Electrokinetic (EK) Enhanced In Situ Remediation – Issue Paper

Engineering Issue Paper developed in coordination between TSCD's Engineering and Groundwater Technical Support Centers (ORD - ETSC & GWTSC)

EIP developed under ORD STREAMS IV Contract, with RTI International, where Geosyntec is a partner

**James Wang**, PhD, from Geosyntec is the primary author

## Electrokinetic (EK) Enhanced *In Situ* Remediation

ENGINEERING ISSUE PAPER

# Acknowledgments

**EIP's Development Co-Lead:** Randall Ross, Director of Groundwater Technical Support Center (GWTSC)

## **Shaping this Document for Our Users:**

- James Ferreira - EPA Region 4 Superfund and Emergency Management Division (SEMD)
- Daewon Rojas-Mickelson - EPA Region 9 SEMD
- James Cummings - OLEM/TIFSD
- Rohit Warriar and Katherine Bronstein – RTI International

## **Technical Reviews and Insights:**

- James Hall - EPA Region 10 SEMD
- John McKernan - ORD/CESER's Land and Remediation Technology Division (LRTD)
- Randy Parker - ORD/CESER/TSCD
- David Gent - US Army Corps of Engineers Research and Development Center Environmental Lab (retired)
- Arvin Farid - Professor of Civil Engineering at Boise State University

# ORD Tech Support Summary

- ORD's stands ready to provide technical support as part of EPA's TSP through its TSCD – including the EIP discussed today.
- ORD's expertise can be accessed through our designated Regional STLs who coordinate with TSCs
  - States and tribes can request technical support through the Regions who then work through TSP
- TSCD's 5 Technical Support Centers (TSCs) and 10 STLs support over 180 requests per year with support from our ORD staff and on-call contracts
- Further information on the TSCs, STLs and our other projects can be found in these links

Appendix C. Case Study #3, EK-ISCO Pilot Test at Cristex Drum Superfund Site, Oxford, North Carolina	55
Appendix D. Case Study #4, EK-BIO Treatability Study For a PCE Source in a Low-Permeability Formation	59

# Challenges and Motivation

Contaminants diffused into low permeability (low-k) materials serve as secondary sources (back diffusion) lasting for decades

EISB and ISCO / ISCR are effective technologies, but amendment distribution is poor in low-k and heterogeneous materials

## Delivery & Contact

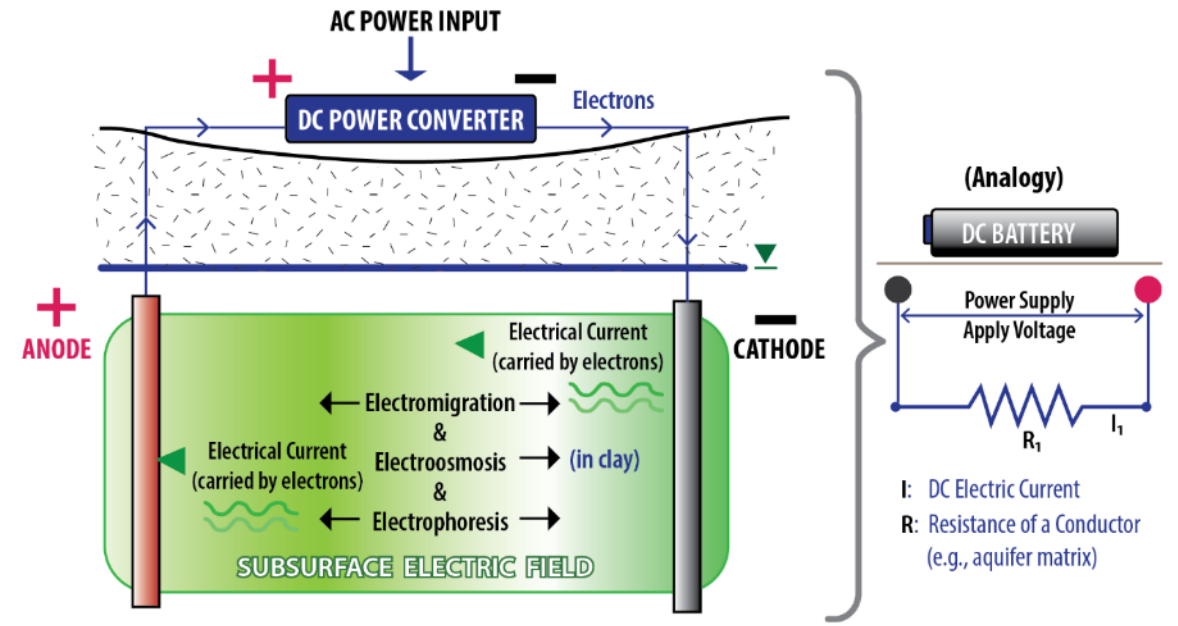

Better & fundamentally improved amendment delivery techniques are needed for low-k sites

From ESTCP, ER-200530

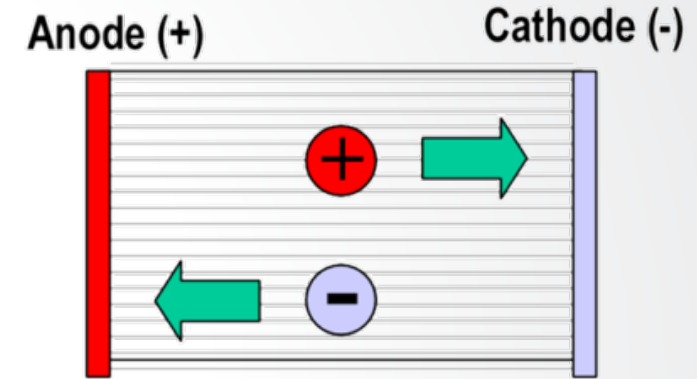

- Application of direct current (**DC**) to saturated formation
- “Powered” by the electric field, select amendments move through clays and silts via:
  - Electro-migration (EM)** – movement of charged ions
  - Electro-osmosis (EO) – bulk movement of water
  - Electrophoresis (EP) – the movement of charged solid particles (e.g., colloids)

## Electrokinetic (EK) for Amendment Transport – Electromigration (Ion Migration)

- **Electromigration** is the movement of ions in an electric field. Ions are attracted to the electrode of opposite polarity.
- Electromigration occurs in the subsurface as long as there is a connected water pathway.
- The transport rate is proportional to the electrical gradient (driving force) of the applied electric field.

Anions: negatively charged ions    Anode: Positively charged electrode  
Cations: positively charged ions    Cathode: Negatively charged electrode

$$J_i = -D_i^* \frac{\partial c_i}{\partial x} - u_i^* c_i \frac{\partial \phi}{\partial x} + qc_i$$

Voltage Gradient

- **Electroosmosis** is the movement of pore fluid and, thus, dissolved constituents induced by a voltage gradient.
- A complex mechanism depending on electrical characteristics of solid surface, property of interstitial fluid, and the interactions between these elements.

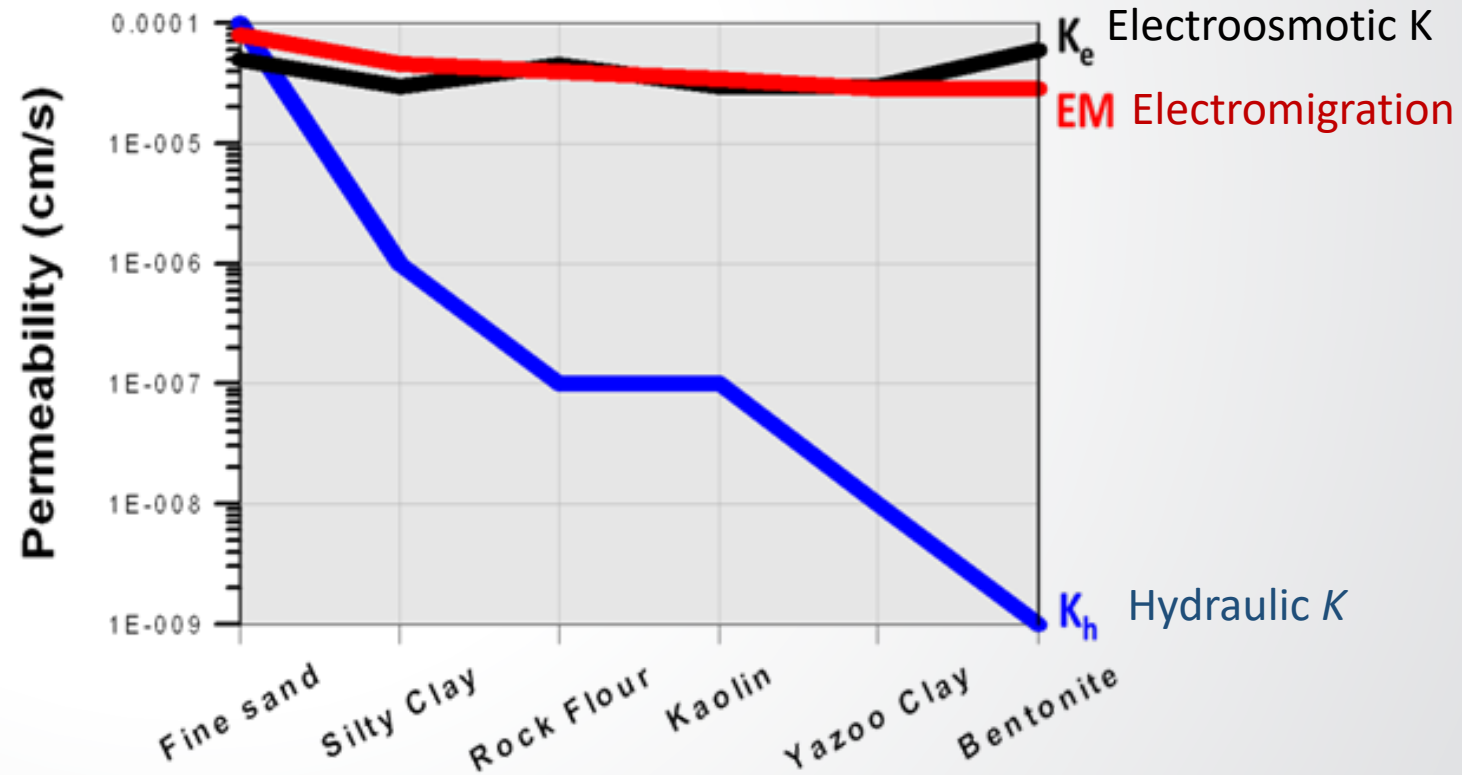

# EK Transport is Fundamentally Different

Why will EK work in low-K formations where conventional hydraulic injection techniques often face challenges?

- EK transport relies on electrical properties of aquifer matrix (not hydraulic)
- Soil electrical properties  $\approx$  between sand and clay
- As  $K_h$  decreases, EK becomes the more efficient delivery method

# Effective and Uniform Amendment Delivery by EK

T = 6 hr  
( $MnO_4^-$  flushing;  
No EK)

T = 12 hr  
( $MnO_4^-$  flushing;  
No EK)

T = 6 hr w/  
2-hr EK  
( $MnO_4^-$  flushing  
with EK)

T = 12 hr w/  
8-hr EK  
( $MnO_4^-$  flushing  
with EK)

## EK Applications for In Situ Remediation

- Remember – **EK** is a remediation reagent **delivery** technology
- For In Situ Bioremediation
- **EK-BIO** : Distribution of electron donors (lactate) or electron acceptors (sulfate, nitrate) and/or microorganisms (*Dehalococcoides*, *Dehalobacter*) to promote biodegradation
- For In Situ Chemical Oxidation Remediation
- **EK-ISCO** : Distribution of permanganate ( $\text{MnO}_4^-$ ) or persulfate ( $\text{S}_2\text{O}_8^{2-}$ ) to promote oxidation

### EIP Structure –

- Introduction;
- Technology fundamentals;
- Stepwise process of feasibility screening, alternative evaluation, developing / designing / and ultimately implementing the EK technology at a site
  - generally following the CERCLA FS and RD framework;
  - enhanced usability for RPMs and remediation practitioners;
- References – over 90 peer-reviewed journal articles and technical reports;
- Also provide select case studies in appendices

# Engineering Issue Paper

## EPA/600/R-23/329 (May 2024)

[Follow the CERCLA FS and RD framework for technology screening / evaluation / selection](#)

Criteria	EK-enhanced Remediation and Project-Specific Considerations
<b>THRESHOLD CRITERIA</b>	
<b>BALANCING CRITERIA</b>	
Long-Term	This criterion considers the ability of an alternative to maintain protection of human health and the environment over time.
<b>MODIFYING CRITERIA</b>	
Cost-Effectiveness	Alternatives will be based on a cost-effectiveness analysis of the expected alternative for a given remedy with an effort to

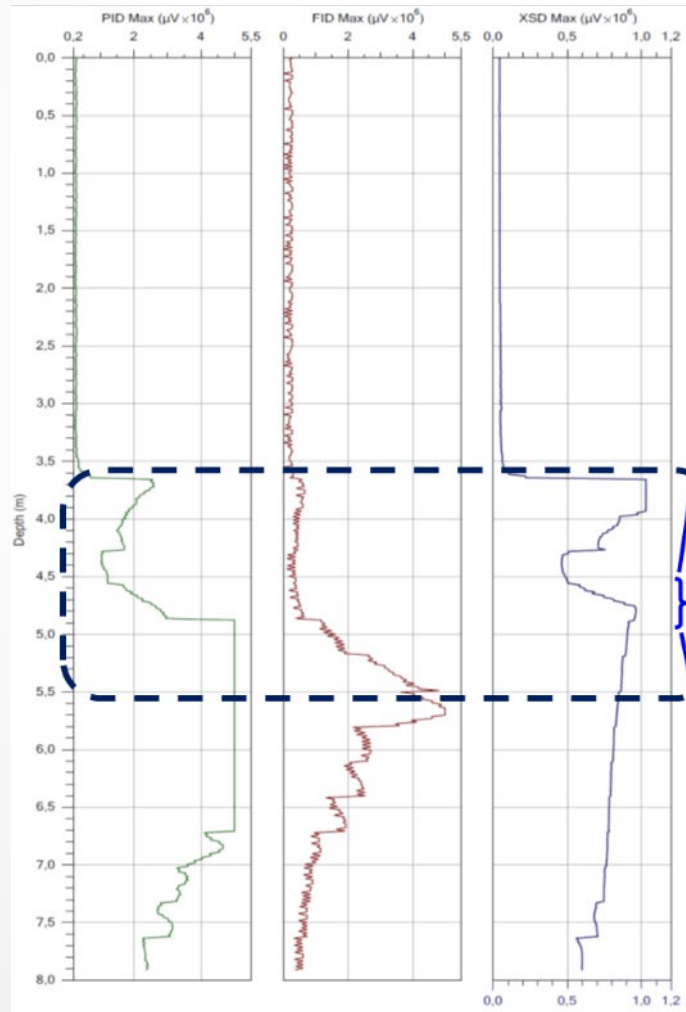

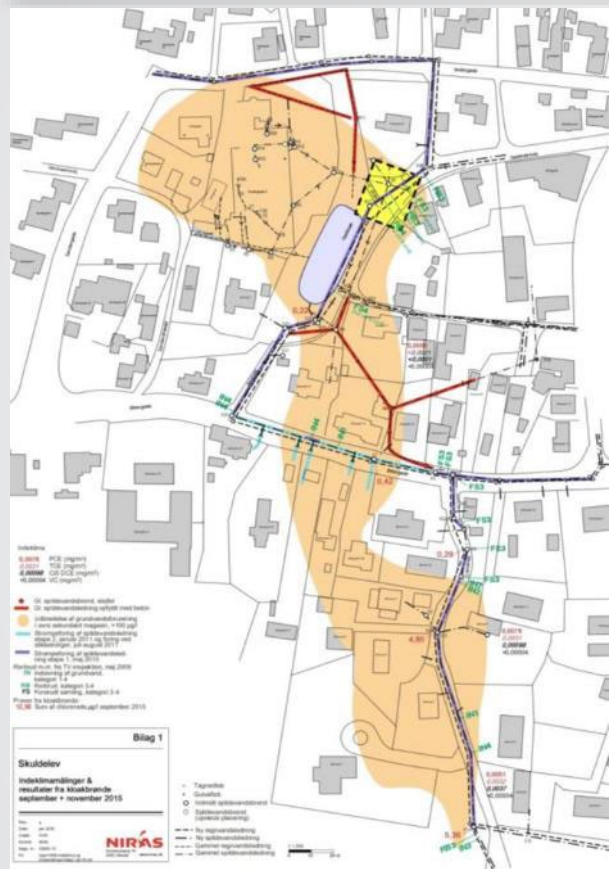

[Supported with select case studies - bench-scale treatability / pilot test / full-scale implementation](#)

### APPENDICES

A. Case Study #1, EK-BIO Full-Scale Remedy in Skuldelev, Denmark.....	42
B. Case Study #2, EK-BIO Pilot Demonstration at Naval Air Station Jacksonville, Jacksonville, Florida .....	47
C. Case Study #3, EK-ISCO Pilot Test at Cristex Drum Superfund Site, Oxford, North Carolina .....	52
D. Case Study #4, EK-BIO Treatability Study for a PCE Source in a Low-Permeability Formation .....	56

# Case – EK-BIO From Bench to Full-Scale, Skuldelev, DK

**Targeting PCE DNAPL in Clay Till**

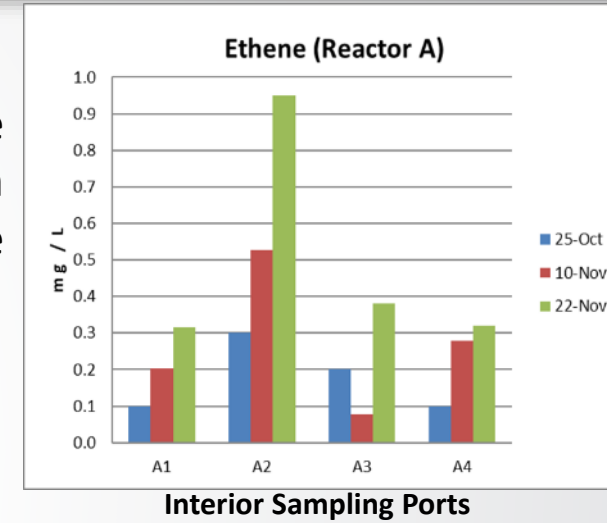

# Bench-Scale EK-BIO Treatability Test

- Bench Scale EK Reactor (40 cm x 15 cm x 5 cm test cell)
- DC power supply and control
- Interior pore-water sampling ports to track the transport progress

Complete dechlorination to ethene

- Electrodes : graphite plates

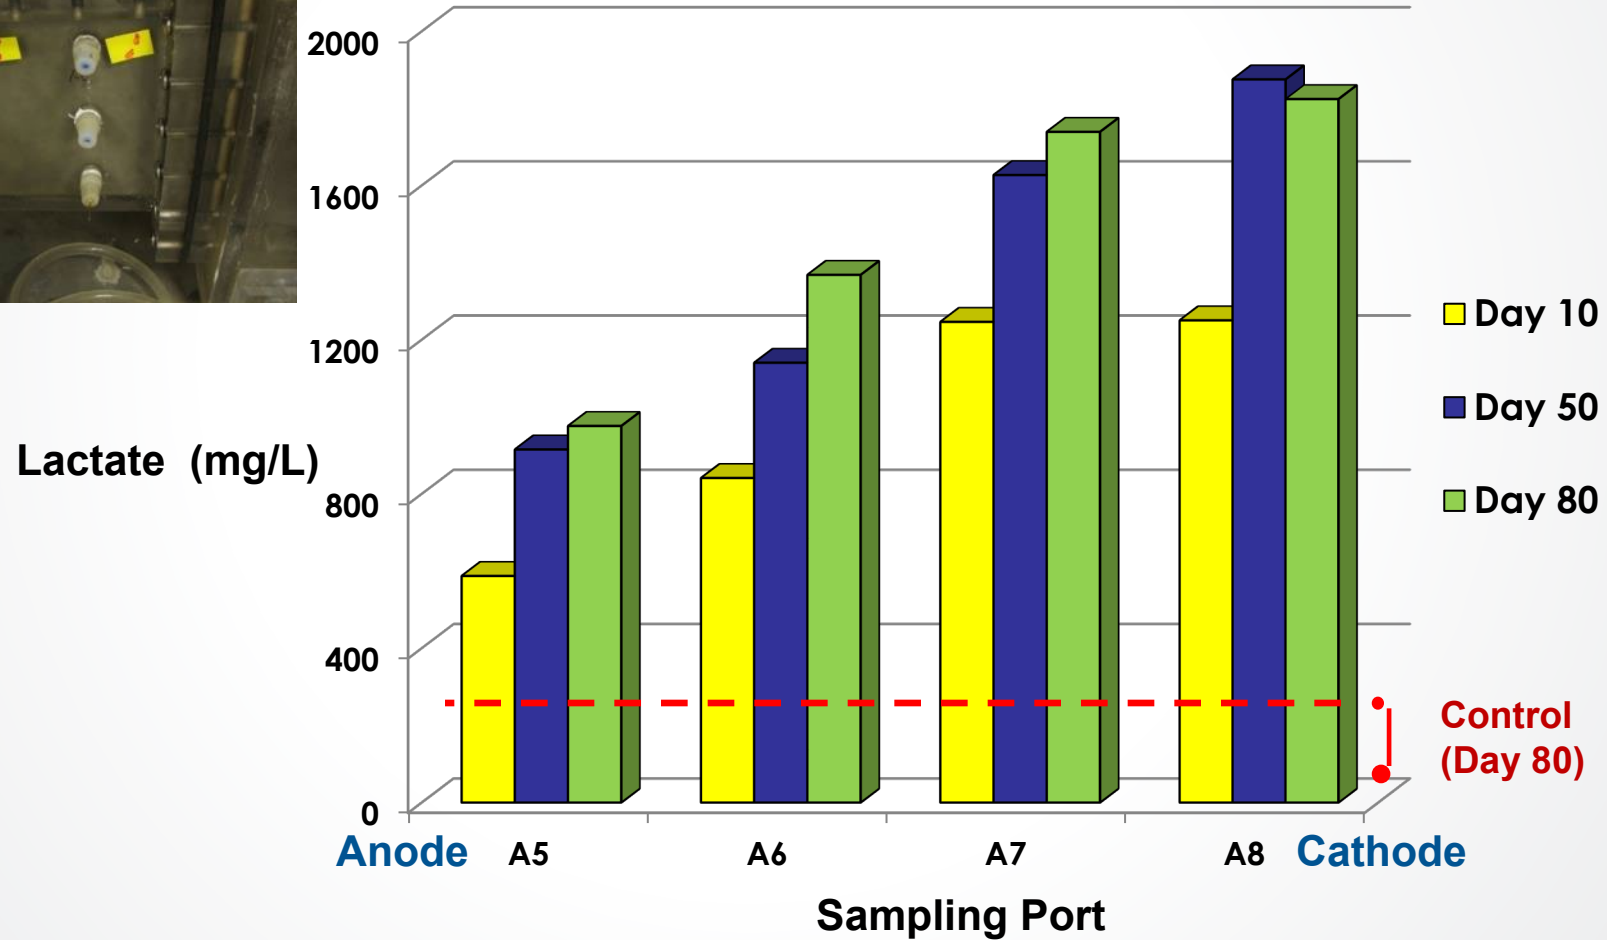

- Two 5-Liter electrode chambers; with cross-circulation & gas vent

# EK Transport of Lactate

Lactate "net" transport rate of 3.2 cm/day

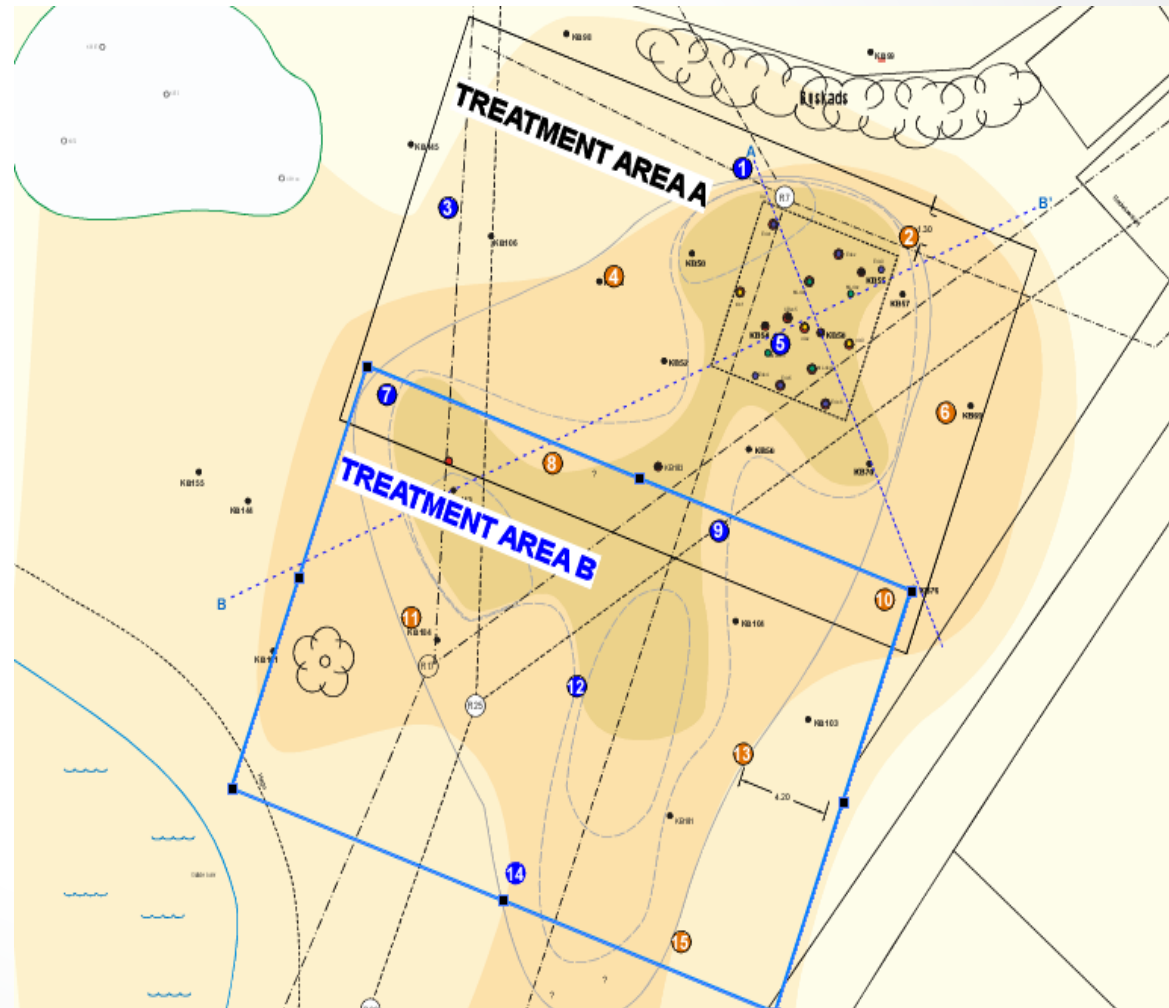

# Full-Scale EK-BIO Implementation

- Following successful treatability test and pilot test
- PCE NAPL Source Area - 40 ft x 60 ft x 24 ft deep
- 15 electrode wells;  
~ 14-ft electrode well spacing
- Two treatment areas;  
alternating active-passive phases of 90 days / phase between areas
- From December 2012 – two years implementation

# Full-Scale EK-BIO Implementation

(No electrode in  
Supply Well)

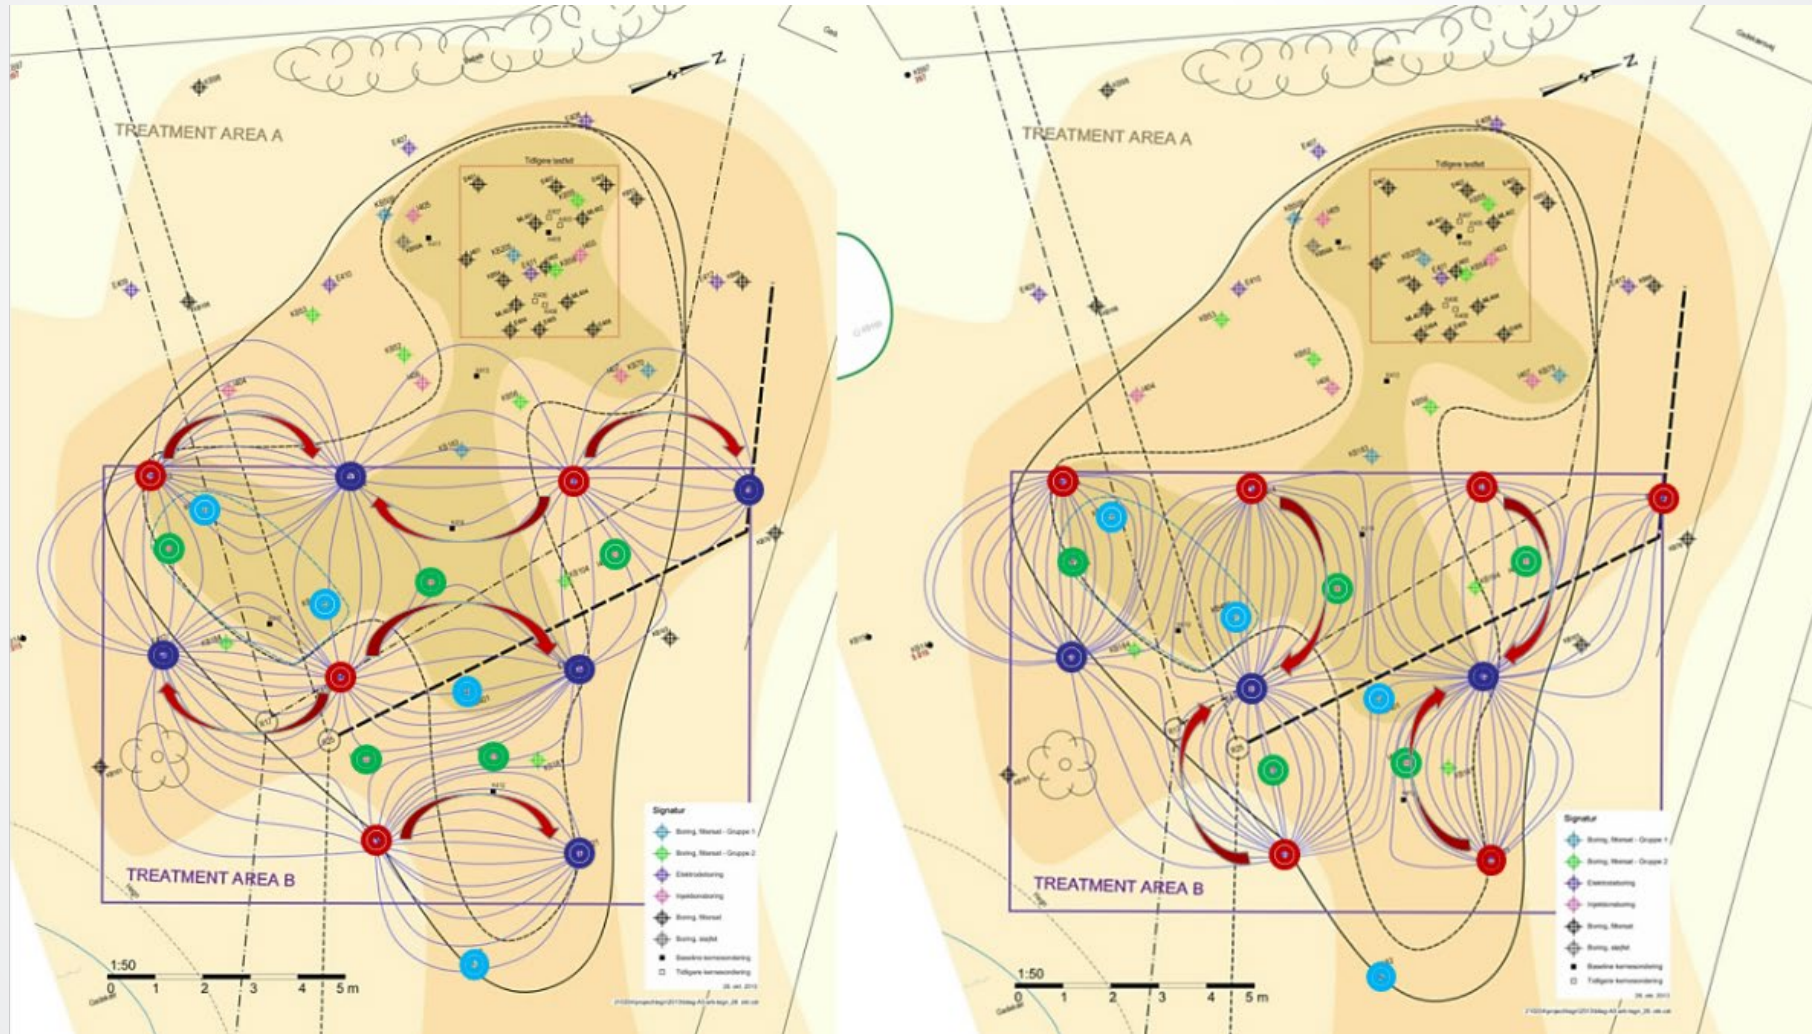

Amendment Supply  
and System Control

- Anodes (+) 
- Cathodes (-) 
- Injection wells 
- Monitoring wells 
- Electromigration: Donor transport 

# Achieved Distribution of Electron Donor

BASELINE

STAGE 2

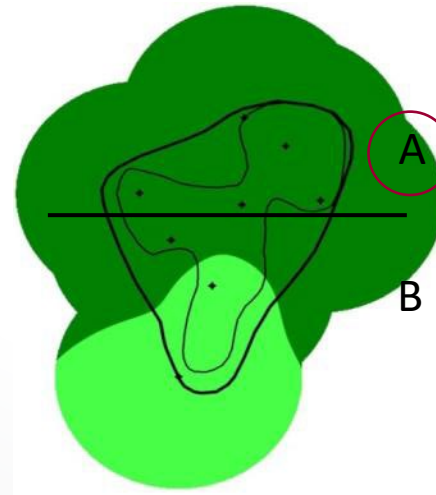

STAGE 4

STAGE 1

STAGE 3

NVOC (mg/l)

□ 1 - 10

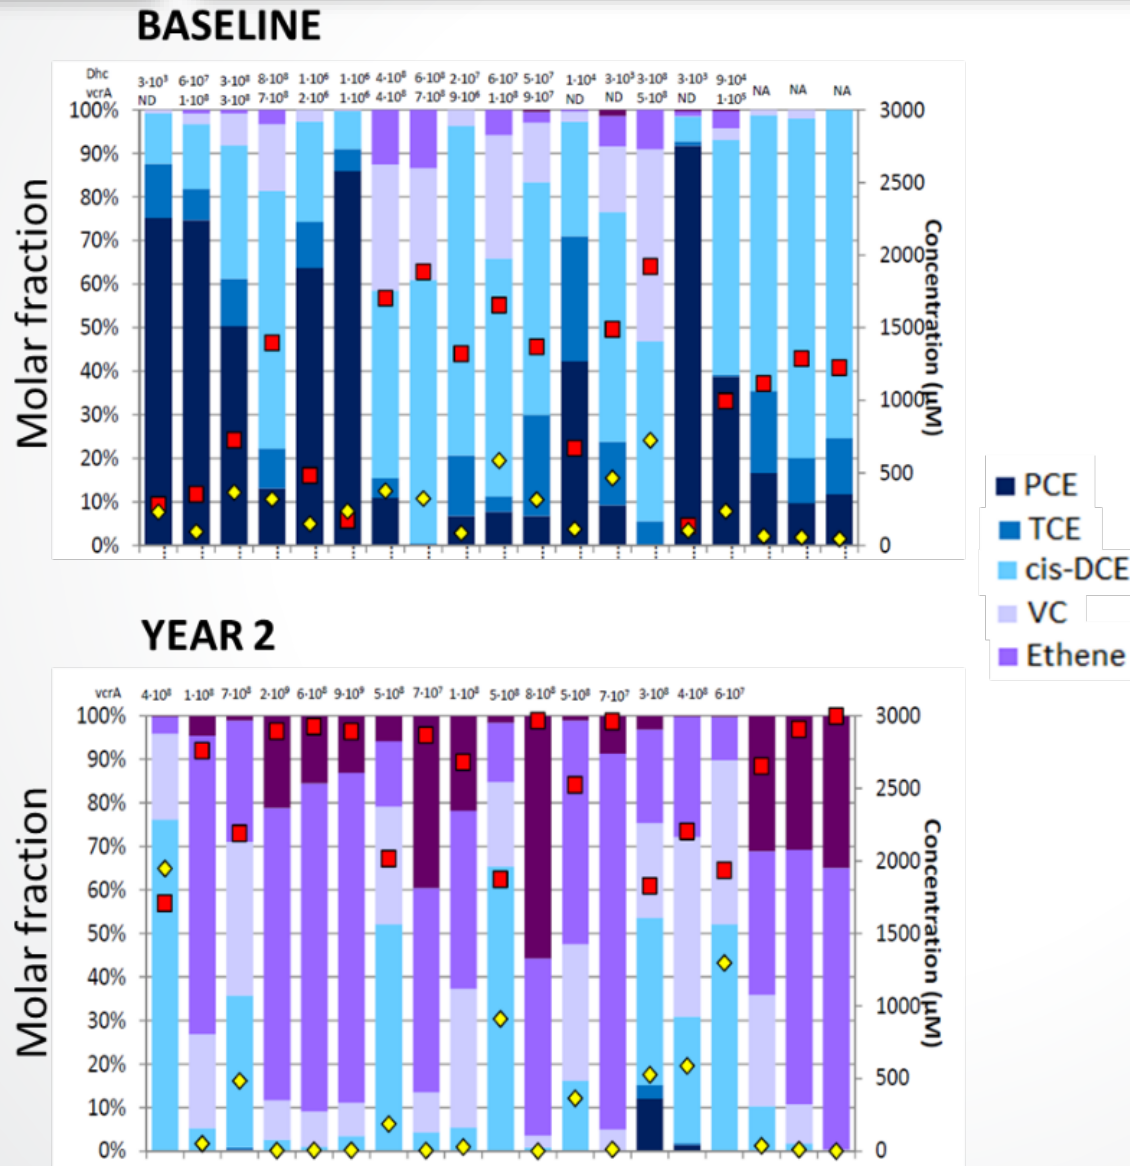

■ 10 - 100

■ 100 - 10,000

# Achieved PCE Reductive Dechlorination to Ethene

GW Quality  
"Signature"

Biodegraded 285 kg of PCE in the treatment zone (>98% of the estimated pre-remedy total).

Rebound testing 6 months after cessation of EK-BIO operation confirmed sustained microbial dechlorination activities (degree of dechlorination increased) and compliance with the remedial goals.

**Capital Region of Denmark:  
No Further Action for Source  
Remediation → GW MNA**

# Case – EK-BIO Field Demonstration at Naval Air Station Jacksonville, Florida

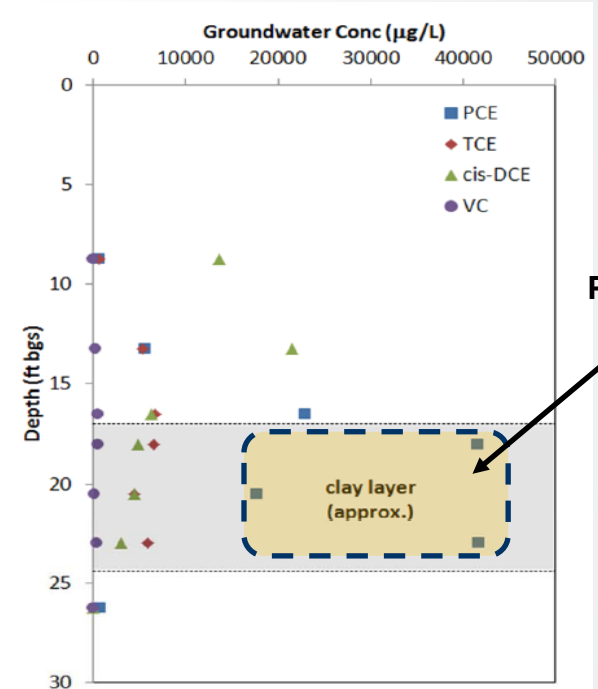

Classic example of contaminant mass diffused into low-K materials.

Long-term source for the shallow sand aquifer plume

- Former dry cleaner
- Source for a large dissolved plume
- Source area now under an active parking lot
- Many existing subsurface utilities

NC – not characterized; SP – sand; CL – clay  
(From ESTCP ER-201032)

# EK-BIO Demonstration Design

~ 35 ft x 35 ft Target Test Area

9 Electrode Wells (~ 17.5 ft spacing)

8 Supply Wells (no electrode)

## Electrode Wells & Supply Wells

- 4-inch PVC casing; 0.01-inch slotted screen;
- Screen interval – 19 to 23 ft bgs (**all within clay**)
- Electrode – titanium rod (3/4-inch dia.) with MMO coating

## DC Power Supply Unit :

Input – 120 / 240V, 3-phase AC

Output – up to 24 A / 250V DC

- Electrode Well
- Supply Well

**Monitoring Wells : double-cased; screened in clay only**

# EK-BIO Remediation Construction / Installation

Parking lot in use during demonstration

EK System Center

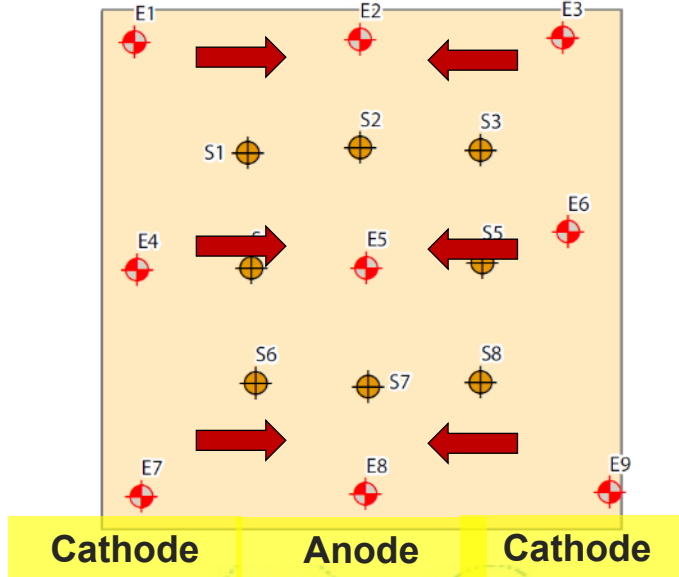

w/ Bioaugmentation of Dechlorination Culture

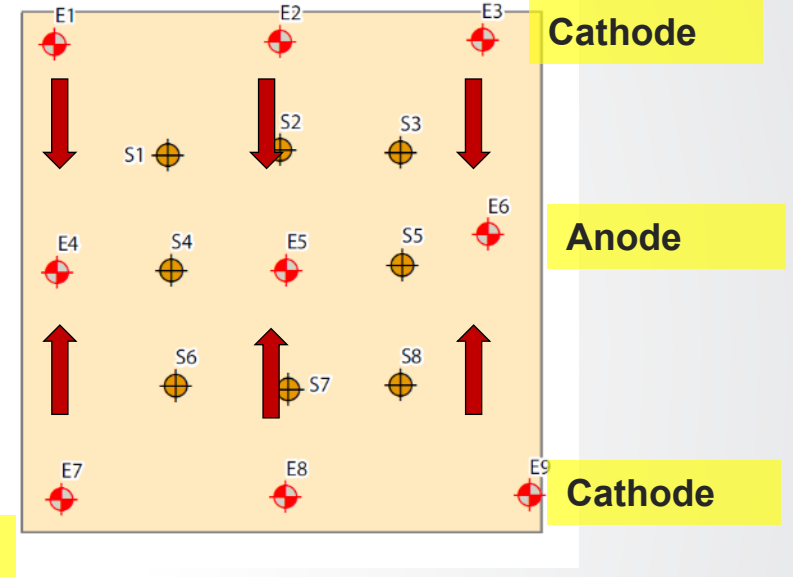

# EK-BIO Remediation Operation

- Two stages, each stage = 5 months active operation
- Electrical Power – **8 A to 9 A;**  
**22 to 31 V**
- Total power ~ **1,500 kW-hr**  
(~ **two 100-W lightbulbs** for the same duration)
- Lactate & Buffer Amendment Supply
- Bioaugmentation at Supply Wells & Electrode wells
- No overpressure injection

## Stage 1 Operation

## Stage 2 Operation

# Groundwater Monitoring Within Test Area – VOCs and Biomarkers

**Apparent and significant increases of dechlorination end products and genetic biomarkers of dechlorination bacteria**

# Microbial Community Structure Analysis by Next Generation Sequencing (NGS)

- **Increased biomass:** total biomass from within test area >> that in background wells
- **Increased microbial diversity within test area:** calculated Alpha diversity (mean local species diversity) in test area >> upgradient and downgradient background wells.

NGS Data  
(source: ASU)

Calculated  
Microbial  
Diversity

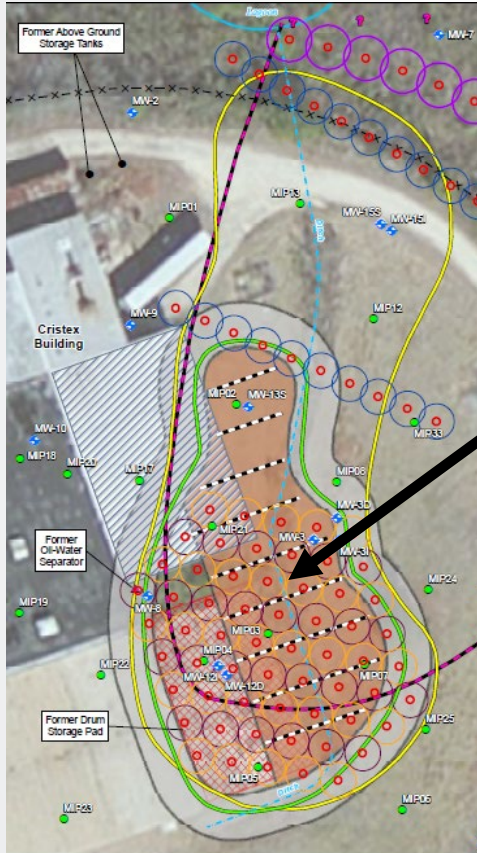

# Case – EK-ISCO Pilot at Cristex Drum Superfund Site Oxford, North Carolina

- Facility operated as a textile manufacturer between 1968 and 1986
- Primary contaminants include VOCs and SVOCs, with **PCE** being the most widespread
- Contaminant source – leaks/spills from former drum storage pad, oil-water separator, above-ground fuel tanks

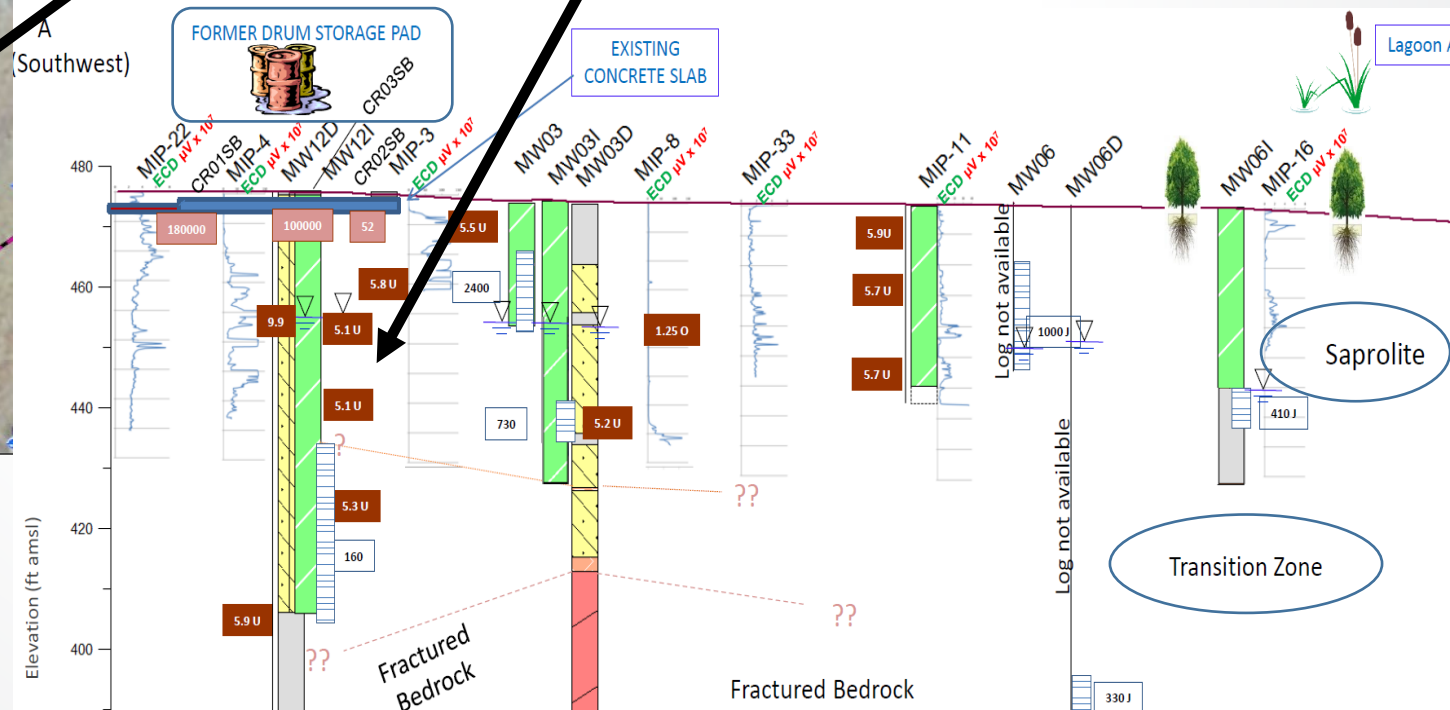

# EK-ISCO Pilot at Cristex Drum Superfund Site Oxford, North Carolina

Objective – Pilot test EK-ISCO for remediation of **PCE** sources in the **saprolite** formation

Saprolite – relatively low-permeability, highly heterogeneous

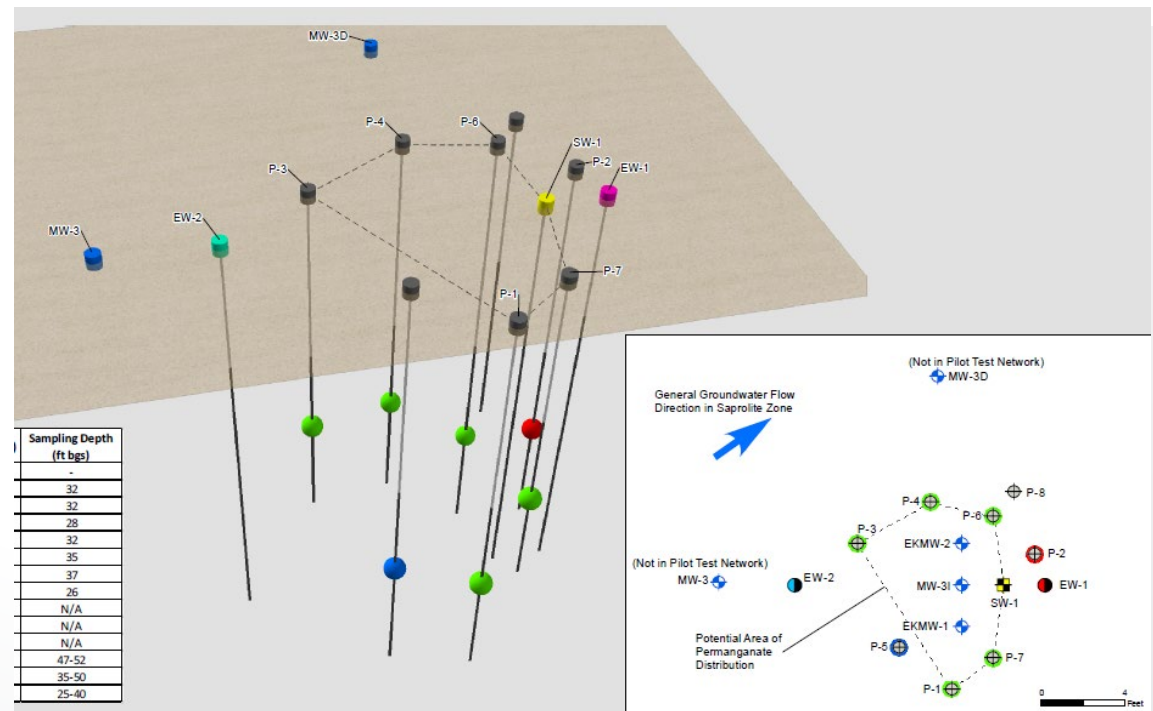

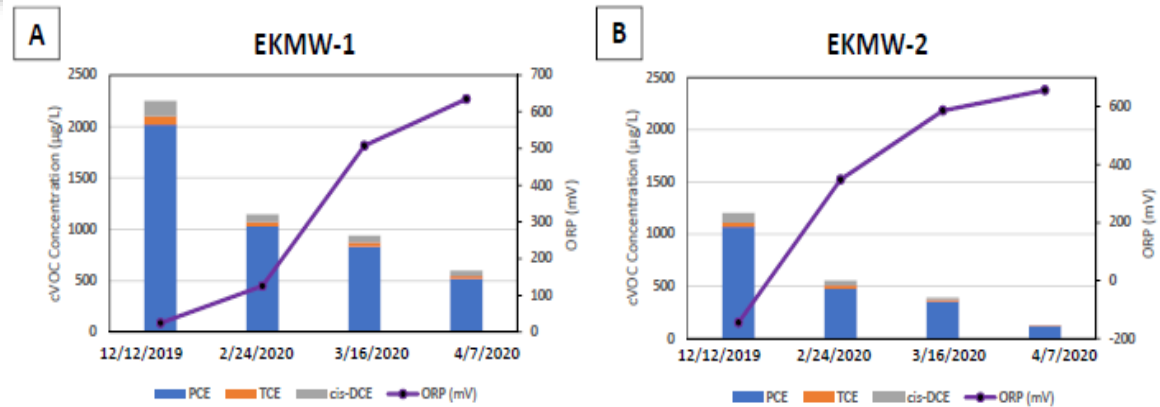

# EK-ISCO Pilot at Cristex Drum Superfund Site Oxford, North Carolina

- EK Transport of **permanganate** within pilot test area (57 days; Jan. – Mar. 2020)
  - Decreases in CVOC concentrations coupled with Increases in ORP
  - Distribution detected cross-gradient and upgradient from supply well (up to 7.3 ft upgradient)
  - EK “net” transport rate for permanganate of **1.3 to 4.1 ft / month in saprolite**
  - 152 kW-hr used over 57 days (low electrical energy utilized)

EK Pilot Test System Trailer

# EK Enhanced In Situ Remediation in Low-K Geology

## Key Takeaway Messages

- **In Situ Remediation Needs Effective Delivery!**
- Achieved treatment **within clay** materials
- Low energy demand [e.g., DC amperage & voltage less than 10A, 35V]
- A **fundamentally different** solution to a vexing problem
- **EIP provides stepwise approach** - technology screening / evaluation / selection through treatability study and pilot test leading to remedial design and remedy implementation
- EIP includes several **case studies** with more specifics
- More technology development ongoing

# Electrokinetic (EK) Enhanced *In Situ* Remediation
