What is RSV disease?

Annual RSV Case Estimates

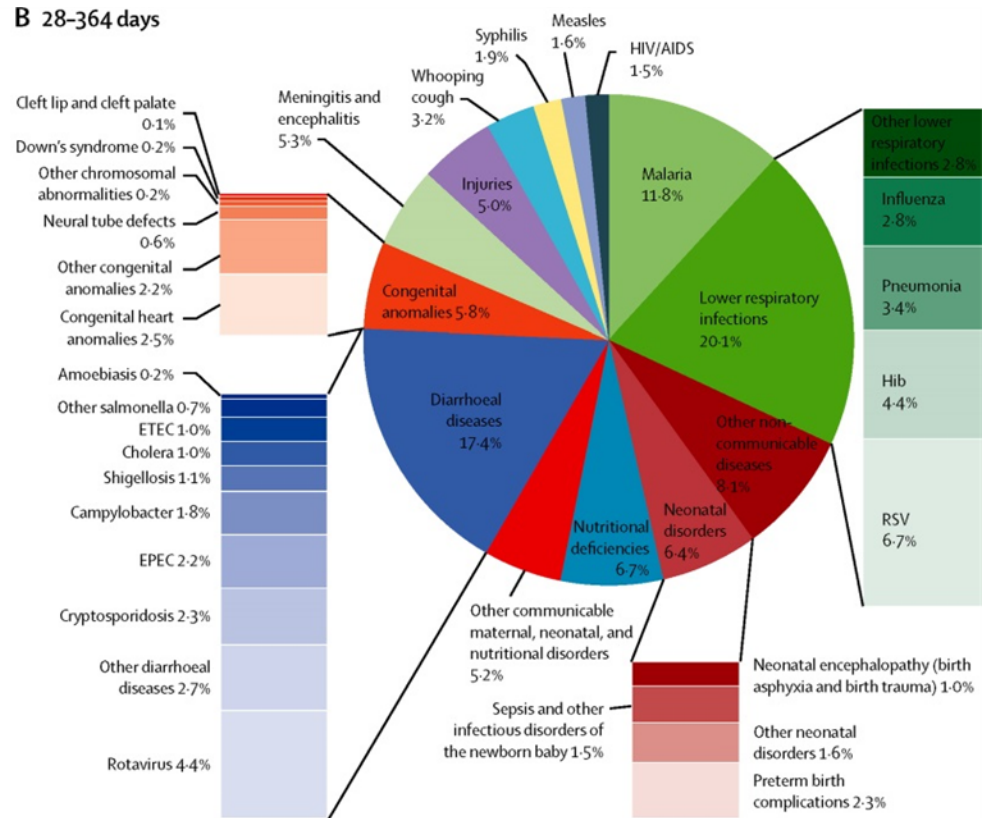

• No vaccine
Adapted from Kurzweil et al, 2013

Global Burden of Disease and the Role of RSV

A 0-27 days

B 28-364 days

Mechanisms of susceptibility and response to RSV infection

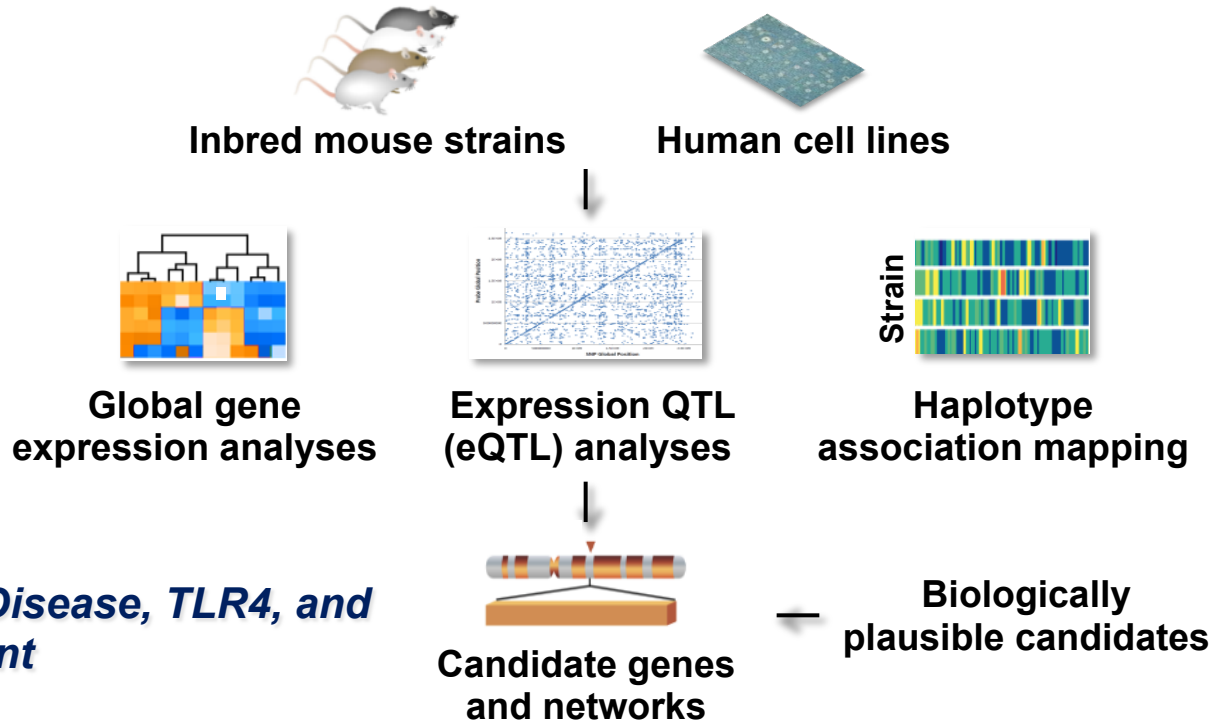

Understanding the genetic basis of susceptibility to RSV disease severity

- **Traditional family-based studies, twin studies, and GWAS studies**
- **Association studies are useful, but candidate genes must be selected carefully**
 - biological plausibility
- **Animal models have proved to be useful to identify genes that contribute to RSV disease subphenotypes**
 - expression array studies
 - genome scan

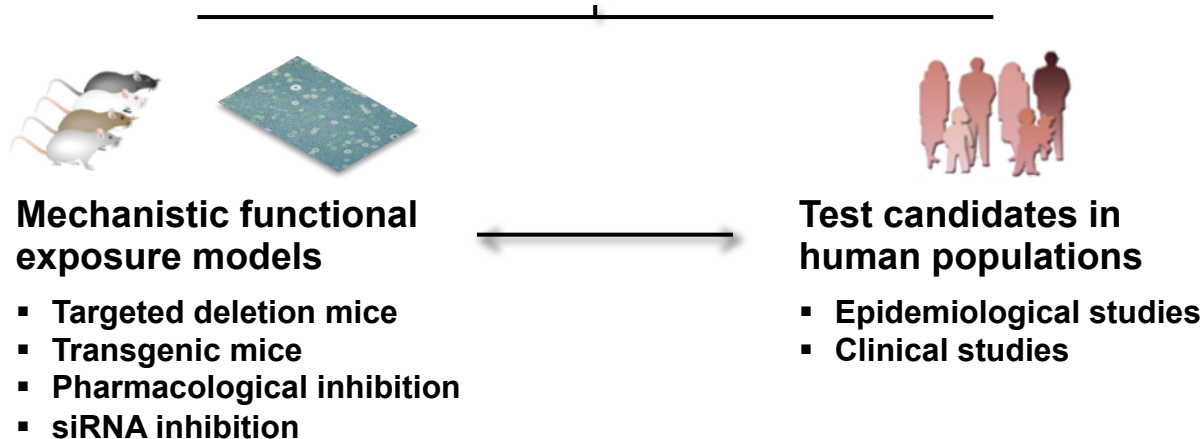

Schematic representation of strategy to identify environmental lung disease susceptibility genes

Study 1. Murine RSV Disease Susceptibility

Study 2. RSV Disease, TLR4, and the environment

Study 1. What are the genetic determinants of susceptibility in a mouse model of severe respiratory syncytial virus (RSV)-induced disease?

Time course of bronchoalveolar lavage (BAL) polymorphonuclear leukocytes (PMNs) and monocytes after vehicle and RSV infection

* p<0.05 vs. vehicle
+ p<0.05 vs. C3H/HeJ
n = 7-9/group

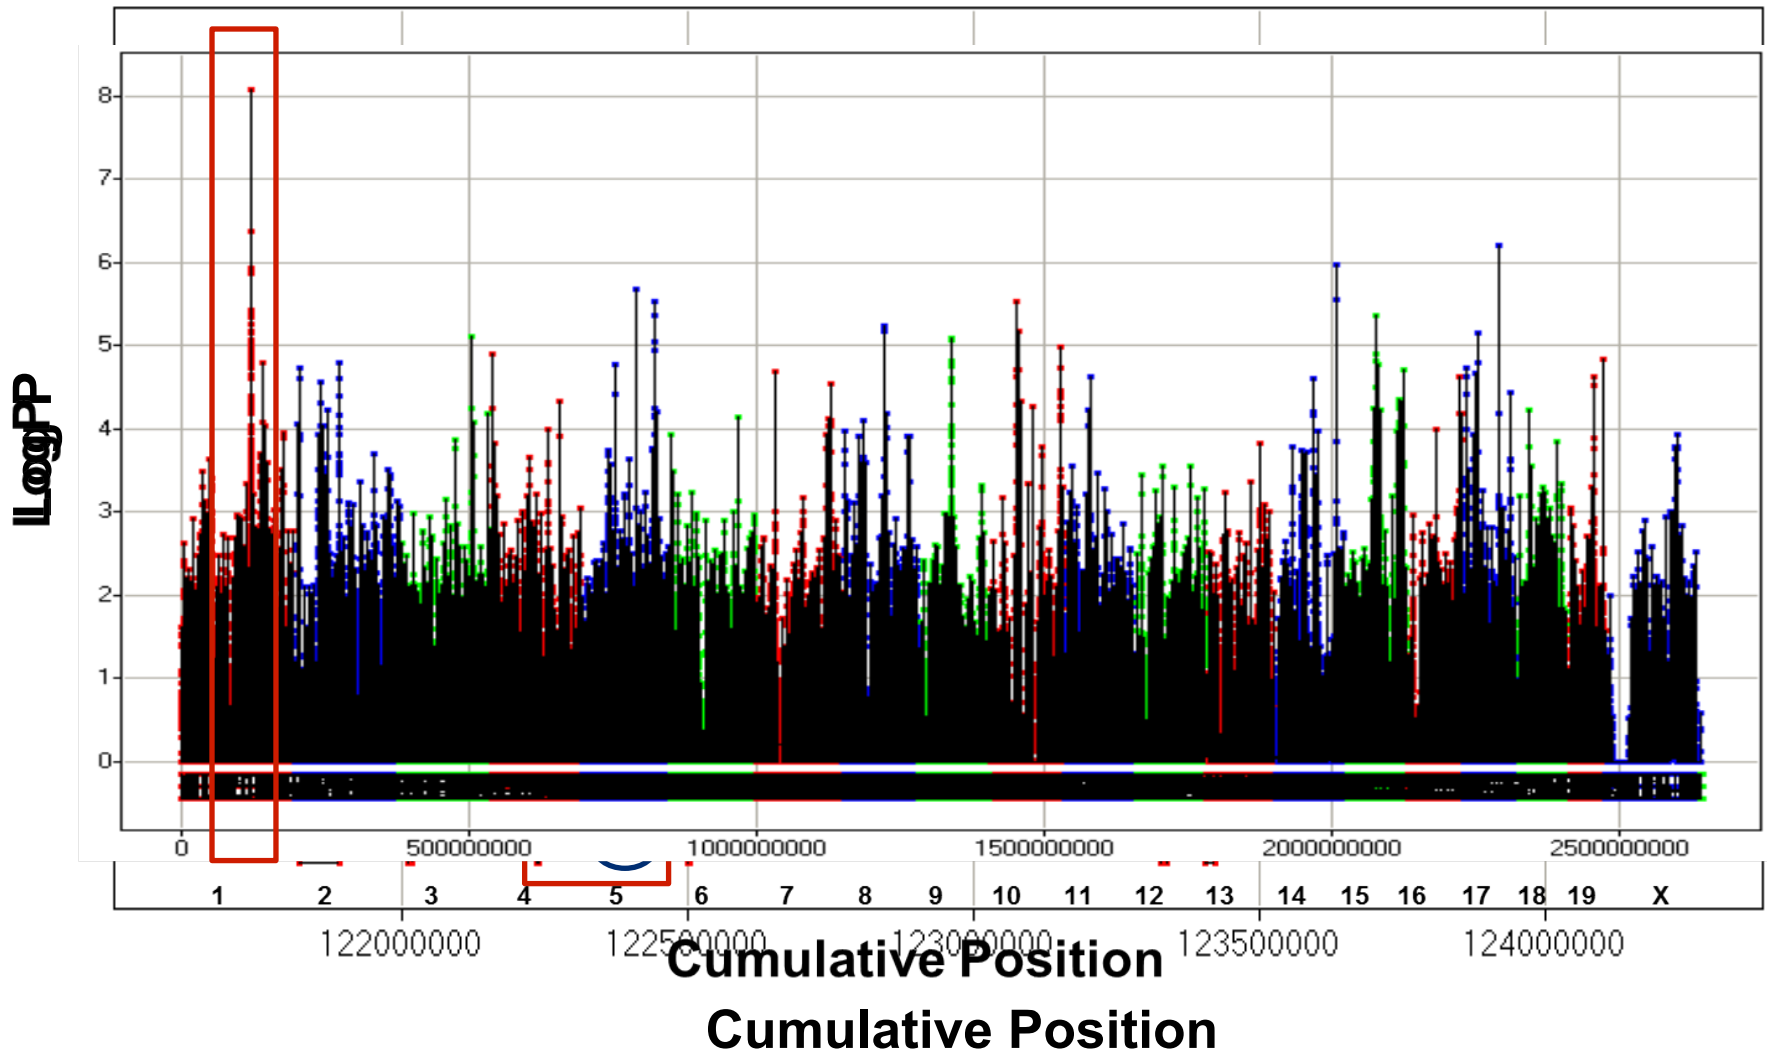

Strain distribution patterns for RSV-induced disease phenotypes

- Inter-strain variation
- Continuous distributions of phenotypes across strains
- Lack of correlation between phenotypes

* within group not significantly different from each other

Manhattan plot for RSV-induced BAL monocytes in 30 inbred strains of mice (SNPster)

MARCO (macrophage receptor with collagenous structure) is a member of the scavenger receptor family

J.E. Murphy et al. / Atherosclerosis 182 (2005) 1–15

Targeted deletion of *Marco* enhances lung inflammation and injury after RSV infection

What is the role of *MARCO* in human RSV disease severity?

Infant Foundation - Buenos Aires, Argentina

The focus of the Infant Foundation basic and clinical research is centered around children's respiratory diseases.

INFANT Director is Dr. Fernando Polack (Monroe Carell Jr. Children's Hospital, Vanderbilt).

Area of influence of Posadas Hospital

Area of influence of Berazategui Hospital

Clinical outcomes

Primary:

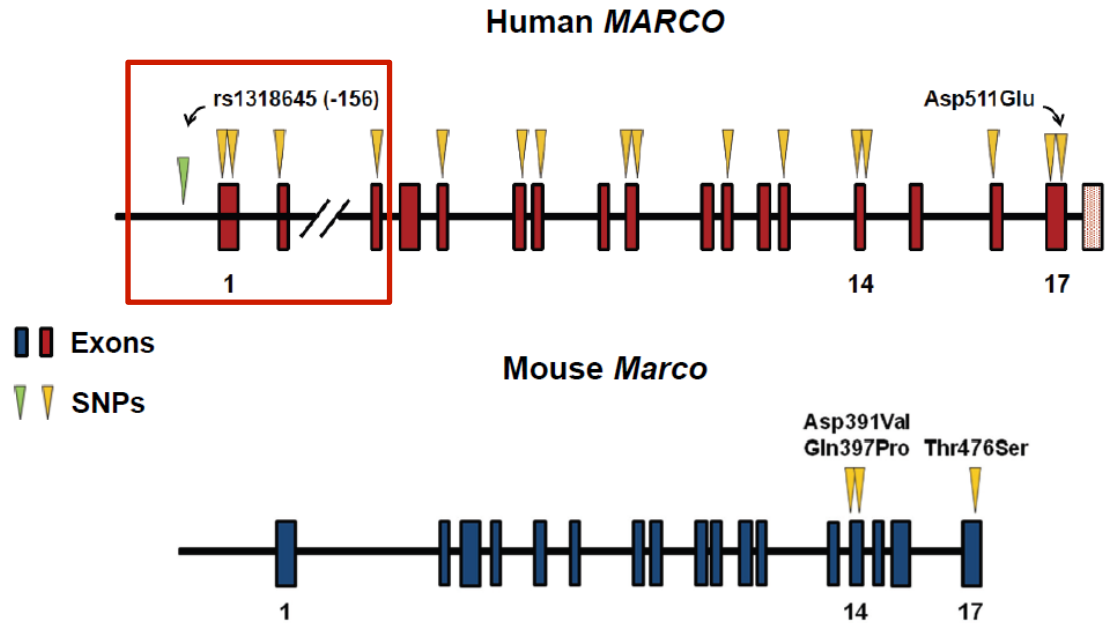

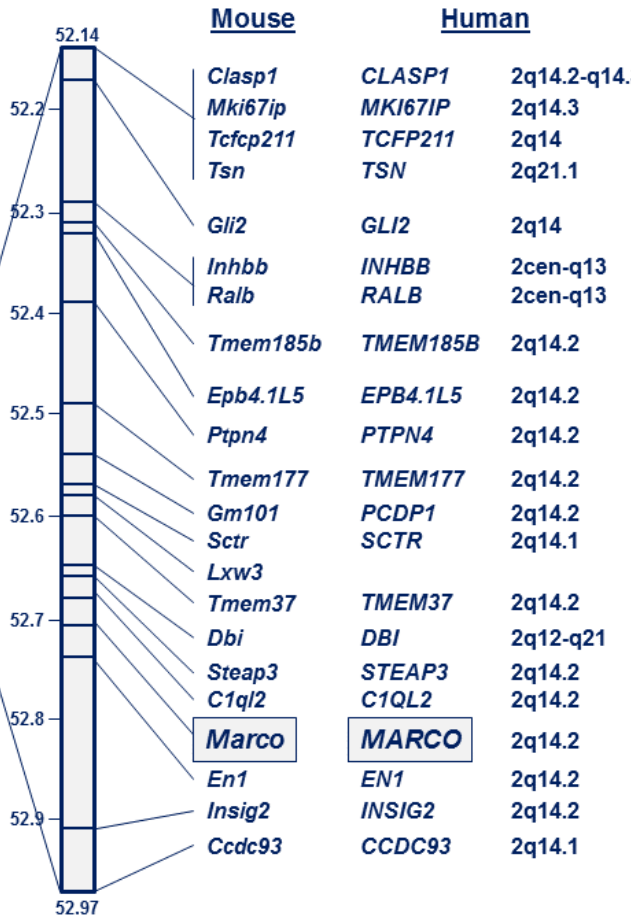

- **Severity of disease. Several clinical scores that are hard to validate or impossible to use (i.e.: $p\text{CO}_2 > 45$; $\text{O}_2 < 87\%$)**

Oxygen saturation $<93\%$

Secondary:

- **RSV titer (Guy et al, *J Infect Dis*, 2004)**
- **Th2 polarization (Choi et al, *J Infect Dis*, 2002)**

Human and mouse comparative homology for *Marco*

Area of influence of Posadas Hospital

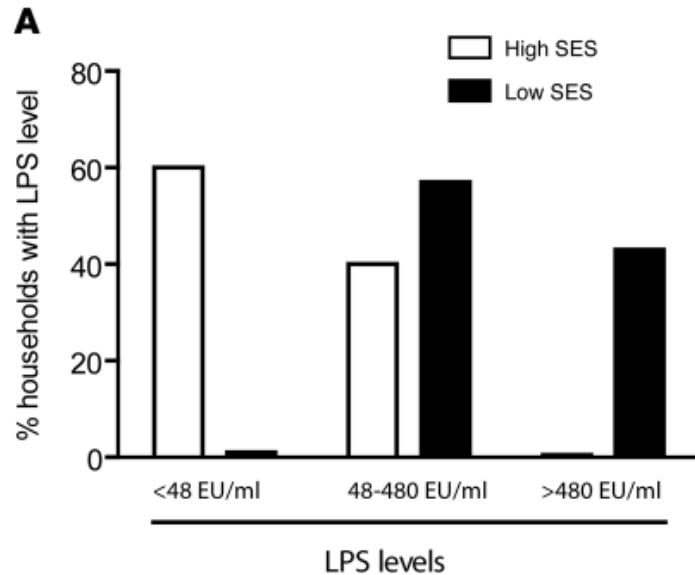

Area of influence of Berazategui Hospital

Percent indicators of socioeconomic differences between the hospital-associated regions

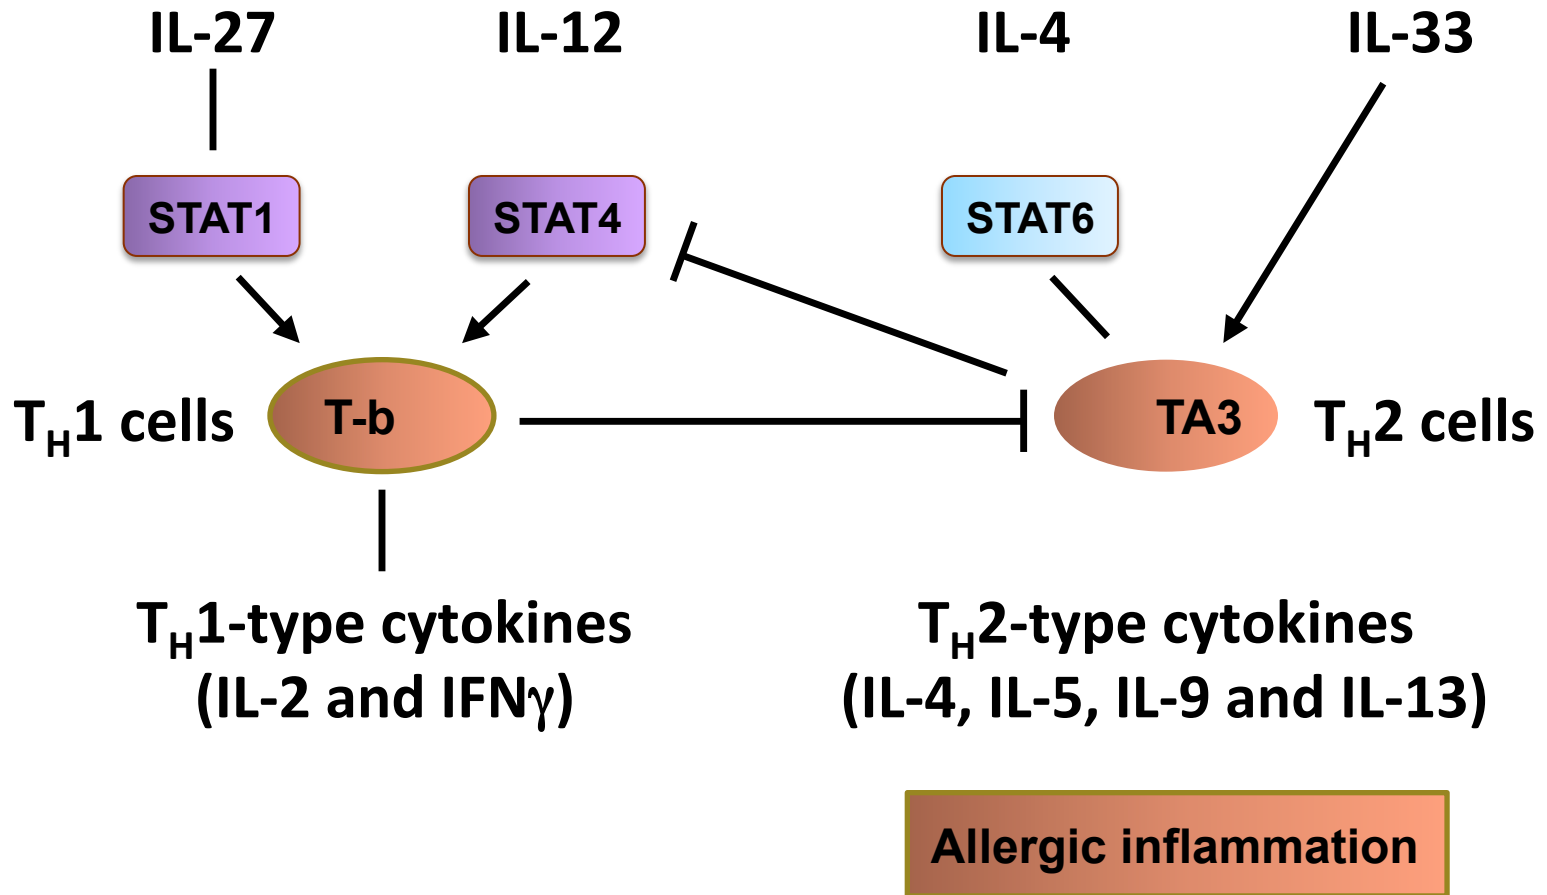

2

	WEST & SOUTH	CENTER
Household below poverty line	22	8
Illiteracy in older than 20 y	15	5
No private medical insurance	65	36
Well-water	42	2
No sewer	37	3

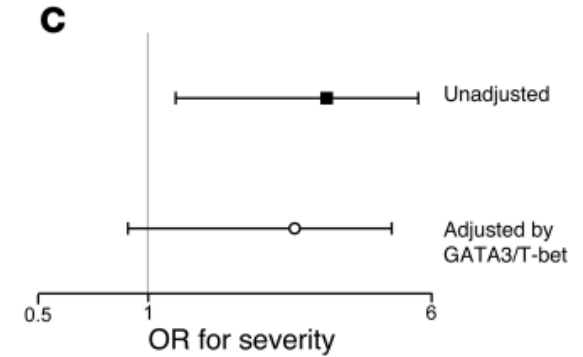

Evidence for gene-environment interaction and RSV disease severity in infants

Interactions between TH1 and TH2 cells in asthma and other allergic diseases

Th2 bias and RSV bronchiolitis in infants with different LPS exposure and socioeconomic status

What is the public health relevance of these models?

- **Annual global RSV disease burden is over 30 million new acute lower respiratory infection episodes in children under five (WHO).**
- **Severe RSV disease in infancy has also been associated with diseases of childhood and adulthood (e.g. asthma).**
- **A diagnostic panel of genetic SNPs could be designed that would also incorporate environmental exposure status (gene x environment interaction) that may be used to predict disease severity.**
- **Intervention strategies could be put in place for at risk individuals, and thus reduce disease burden.**
