# Volatile Organic Compounds and Cardiometabolic Disease

September 04, 2018

## LEADING CAUSES OF DEATH FROM THE ENVIRONMENT

Environmental pollution accounts for 9 million deaths worldwide, out of which 6 million deaths are attributed to air pollution

# Louisville and Superfund Sites

## Valley of Drums

- Hazardous waste in metal drums dumped in open pits and trenches
- Leached into Wilson Creek, a tributary of the Ohio River

## Lee's Lane

- 112 acres wooded and open land
- Flood control levees separate landfill from Riverside Gardens residential area
- 212,400 tons of domestic, commercial, solid municipal and industrial wastes disposed

# Priority Ranking of VOCs in Agency for Toxic Substances and Disease Registry

Vinyl Chloride (#5)

Benzene (#6)

Chloroform (#11)

Trichloroethylene (#16)

Acrolein (#31)

Carbon tetrachloride (#50)

Xylene (#64)

Toluene (#74)

1,3-Butadiene (#153)

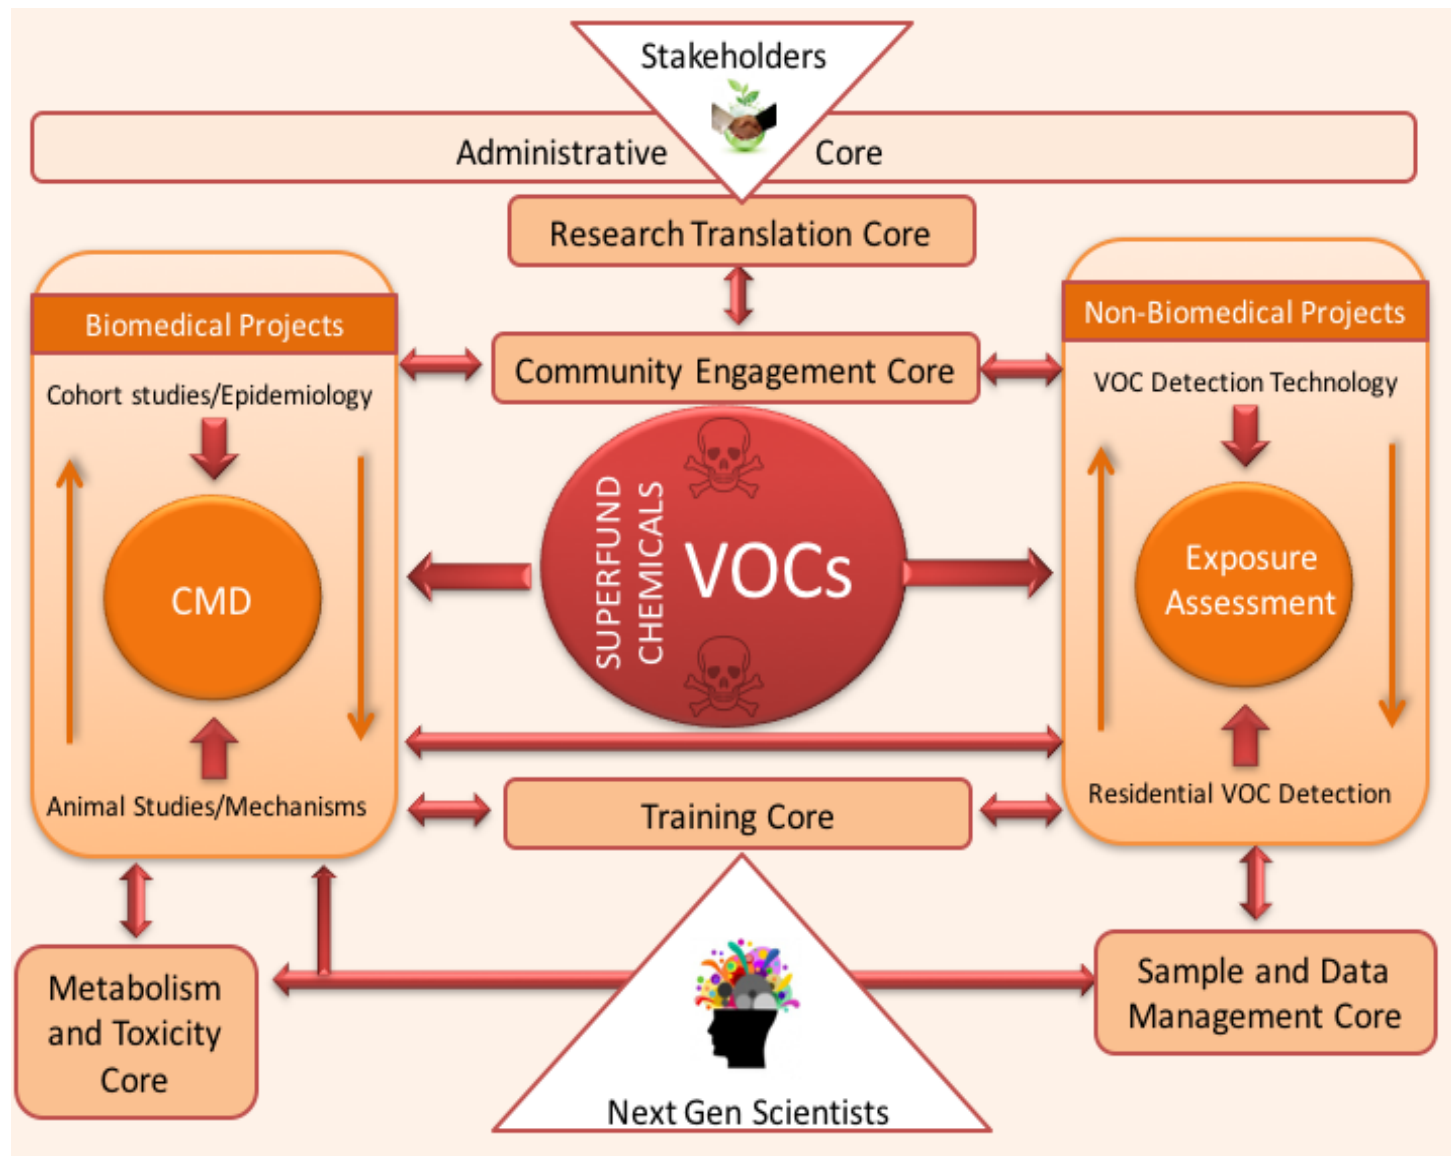

Sources: Industrial solvents, gasoline products, wood preservatives, cleaners and disinfectants

# Increased Exposure to VOCs near Superfund Sites

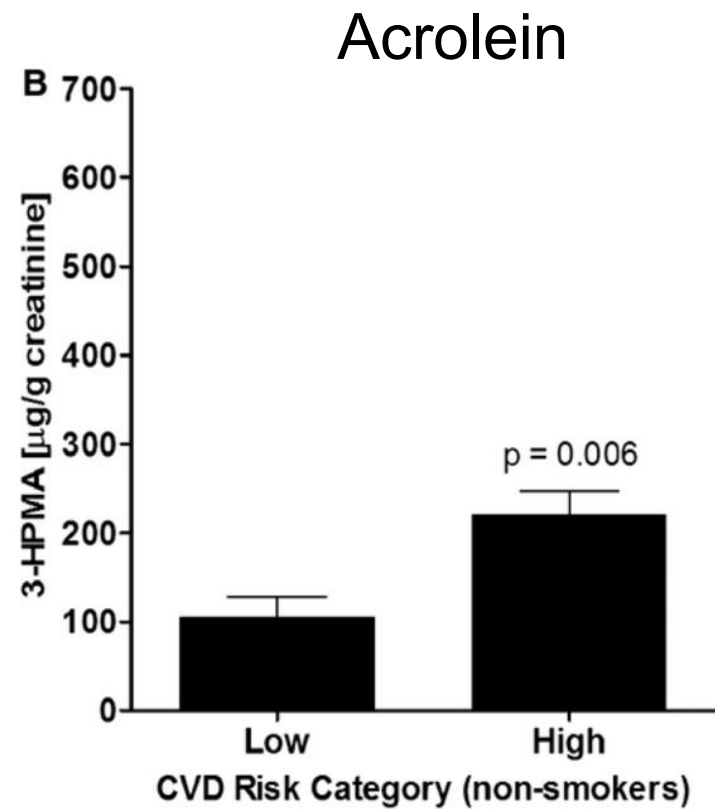

- Excessive rates of T2D (8,200 excessive cases) and stroke (8,600 excessive cases) have been found in an evaluation of 720,000 individuals living within a half-mile of 258 Superfund sites that were associated with excessive VOC in the drinking water.
- Levels of benzene, chloroform, and TCE were found to be appreciably higher than EPA levels in 107 houses near the Del Almo and Montrose Superfund sites in 2016.
- A train (carrying hazardous chemicals) derailment in Louisville caused the release of 1,3-butadiene and forced an evacuation of the neighboring area in 2012.

*There is very little toxicological data on the cardiometabolic effects of VOCs*

# Center Structure

# VOCs and Cardiovascular Disease Risk

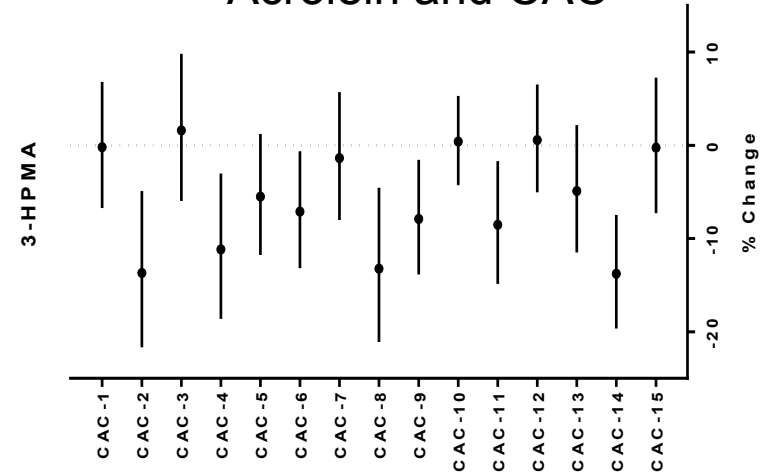

# VOCs and Circulating Angiogenic Cells

High vs. Low VOC Exposure

Acrolein and CAC

Benzene and CAC

# Association of Acrolein and Crotonaldehyde with Atherosclerosis in JHS

## Adjusted associations of urinary VOCs with aortic iliac calcification

VOC aldehyde	r	P-value
Acrolein (3HPMA)	0.34	<0.001
Crotonaldehyde (HPMMA)	0.38	<0.001

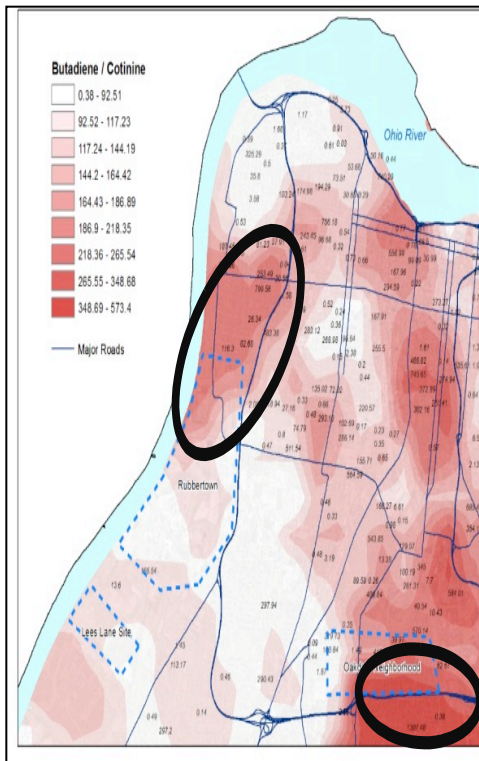

These associations remained significant after adjusting for age, sex, body weight, systolic blood pressure, HbA1c, and estimated glomerular filtration rate, as well as urinary nicotine and cotinine levels.

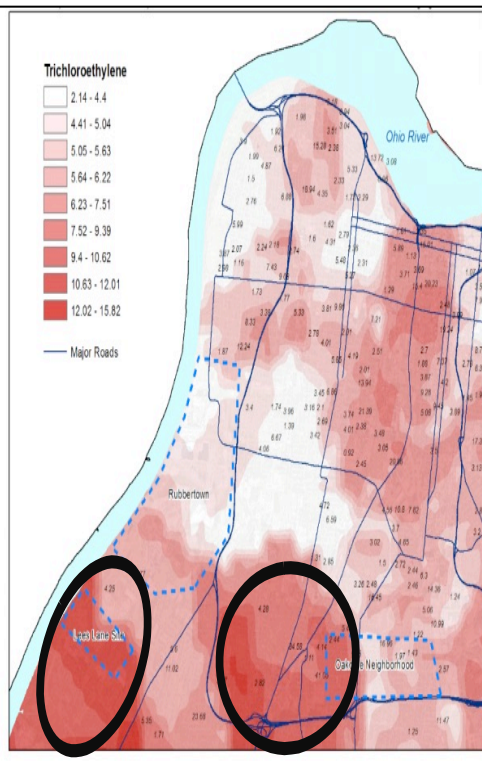

# VOC Levels Near Lee's Lane Superfund Site

## Hypothesis

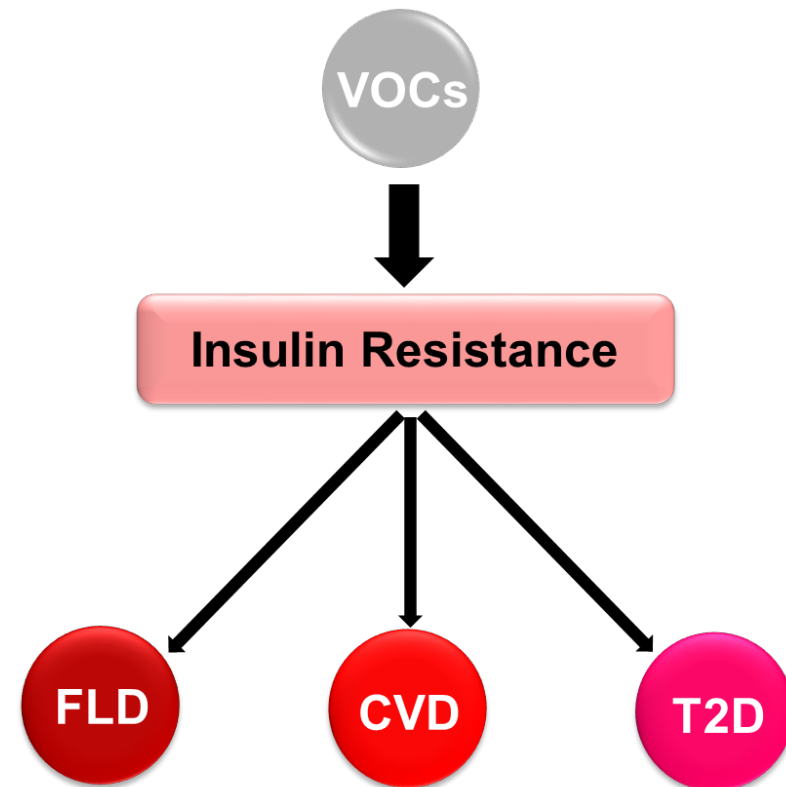

1,3-Butadiene

Trichloroethylene

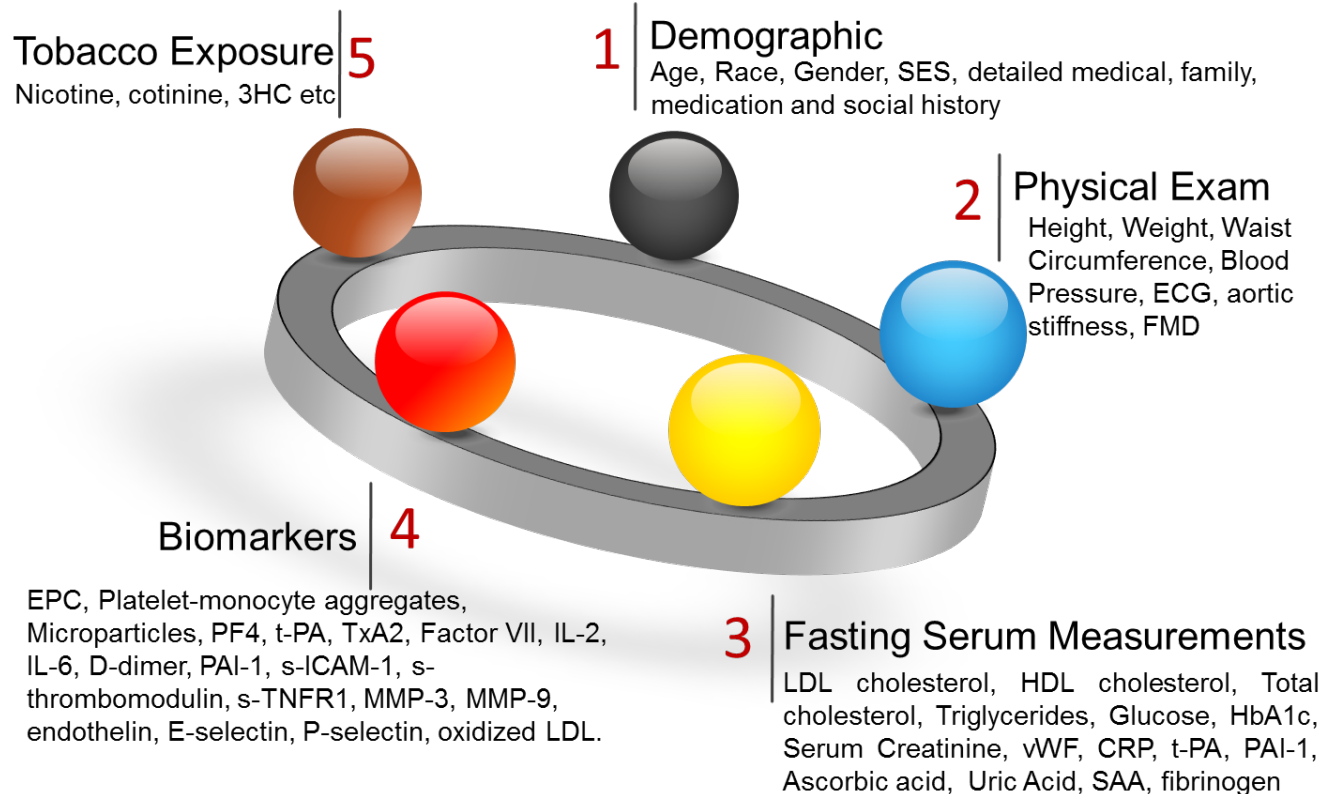

Highest levels of butadiene were observed in neighborhoods of Rubbertown and Oakdale and TCE levels were highest in residential area near the Lee's lane Superfund site

# Project 1: Population Based Study

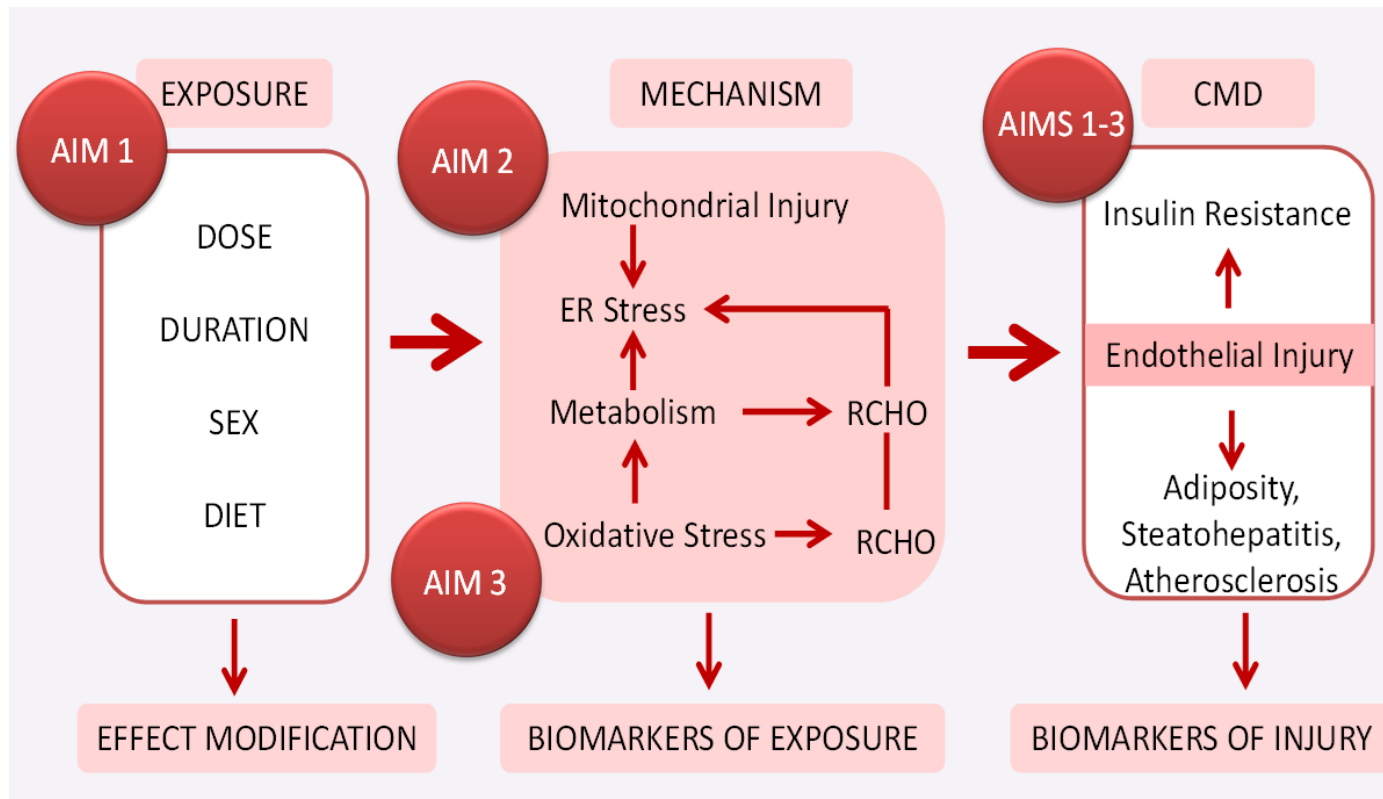

Five hundred participants followed longitudinally

Is obesity a risk Modifier?  
50 obese+100 non-obese

# Project 2: Pre-clinical Studies

- Examine the effects of VOCs exposure on endothelial function and insulin resistance.
- Delineate the contribution of endothelial UPR to the cardiometabolic toxicity of VOCs.

# Project 3: VOC Sensor Development

---

- **Challenge**

Ambient VOC concentrations normally range from a few parts per trillion (ppt) to a few parts per billion (ppb)

- These trace levels strain the detection limits of GC-MS

- **Objective**

Develop novel technologies for quantitative analysis of VOCs to improve both lab and on-site measurements

- **Approach**

Microfabricated gold-based gas sensors and sensor arrays

- Initially focus on detection and quantification of vinyl chloride, acrolein, benzene and 1,3-butadiene

# Project 3: Chemiresistor Platform Technology

Microfabricated Pt interdigitated electrode coated with surface-functionalized gold nanoparticles

Urea thiol-functionalized gold nanoparticle sensor for sensing acetone

# Project 4: VOC Spatial Variability

- **Hypothesis**

VOCs of interest may exhibit high spatial variability at urban, and possibly neighborhood, scales because of differential patterns in emission sources and their zones of influence

- **Objective**

- Characterize urban- and finer-scale spatial variability for select VOCs

- **Approach**

- Design, construct and validate a novel portable field gas chromatograph (GC) suitable for mobile-based monitoring
- Measurements in neighborhoods identified by the urinary metabolites study
- Land use regression model to quantify the small-area variation in VOCs and to estimate residential level exposures

# Project 4: VOC Mobile Monitor

**Sample Inlet and Calibration**

**Trapping**

**Gas Chromatography**

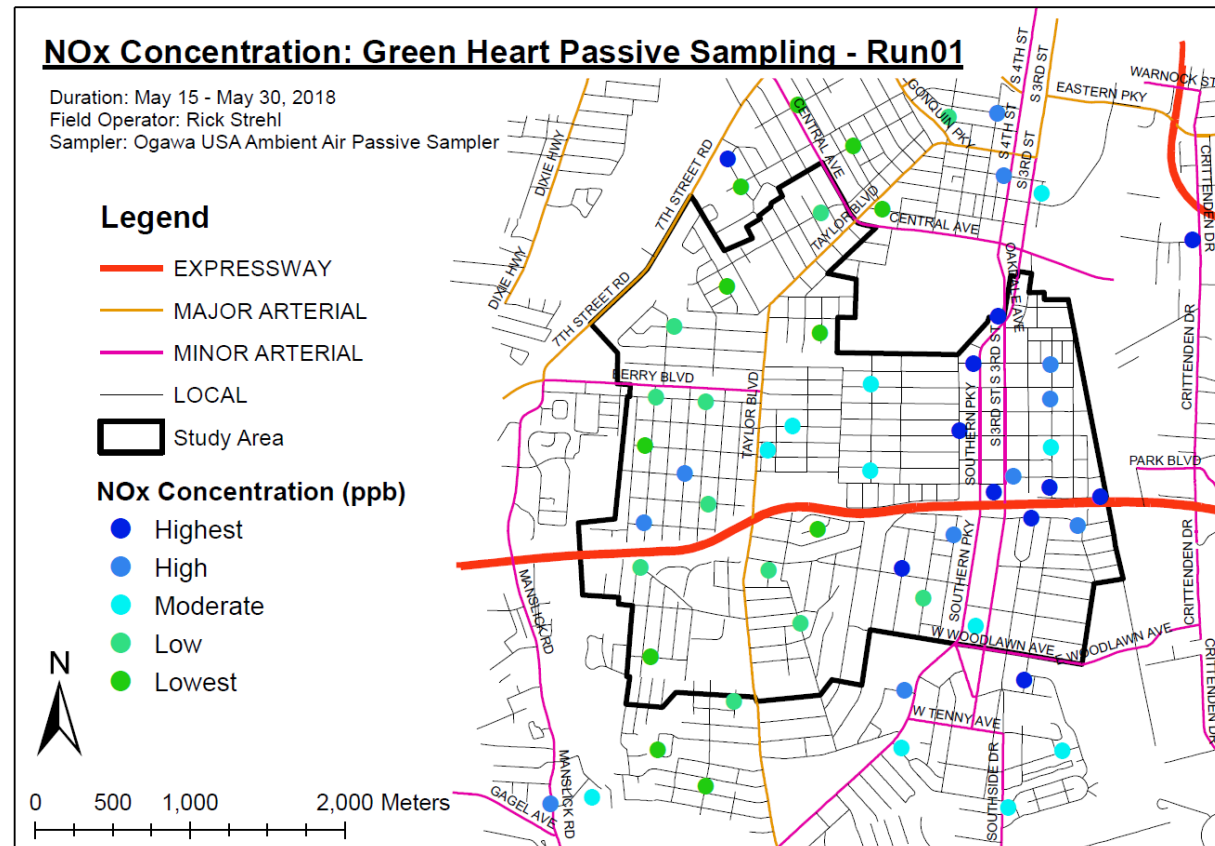

**Vacuum & Mass Spectrometry**

# Project 4: VOCs in Context

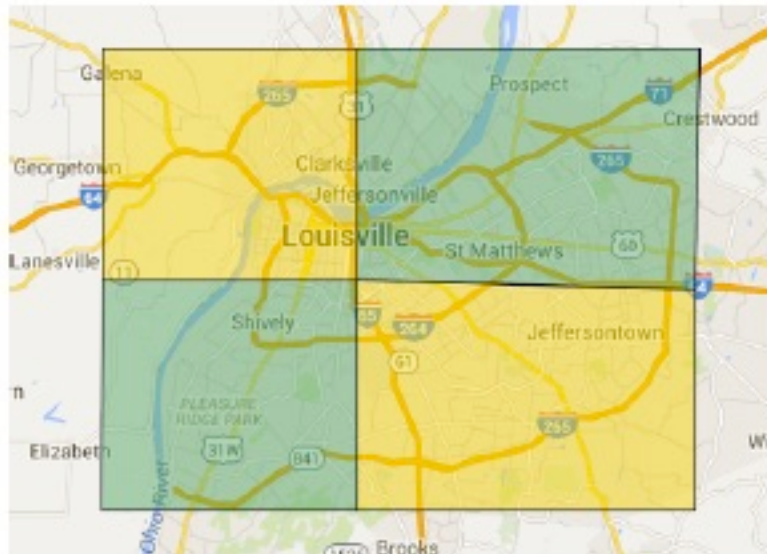

- How will VOCs spatial variability differ from NO<sub>x</sub>?
  - NO<sub>x</sub> passive sampling (figure) and NO<sub>x</sub> mobile measurements (forthcoming) to provide a context for VOCs, including insights into VOC sources

## RESEARCH TRANSLATION CORE

1. Facilitate communication between Louisville Superfund Center, the community, policy makers and public health organizations
2. Disseminate research findings
3. Furnish educational information to the CEC and Training Core

## Air Quality Daily Report For Louisville (Last 24 Hours)

*We are currently monitoring the parameters of PM<sub>2.5</sub> (small particulate matter), PM<sub>10</sub> (large particulate matter) and O<sub>3</sub> (Ozone)*

**The best Air Quality** was in Southwest Louisville Kentucky with an AQI value of 9 which is GOOD

**The worst Air Quality** was in Southeast Louisville Kentucky with an AQI value of 58 which was MODERATE

**The average Air Quality** for Louisville, Kentucky was 28 which is GOOD

Air Quality Index (AQI) Values	Levels of Health Concern	Colors
When the AQI is in this range:	Air quality conditions are:	as symbolized by this color:
0-50	Good	Green
51-100	Moderate	Yellow
101-150	Unhealthy for Sensitive Groups	Orange
151-200	Unhealthy	Red
201-300	Very Unhealthy	Purple
301-500	Hazardous	Maroon

### About The Metrics

**Best Air Quality:** This is the lowest AQI value across all quadrants and parameters monitored

**Worst Air Quality:** This is the highest AQI value across all quadrants and parameters monitored

**Average Air Quality:** This is the average AQI value across all quadrants and parameters monitored. This metric averages all hourly recorded values for all sensors over the last 24 hours

AIR BARE

# REMEDIATION

**PLANTING TREES TO PREVENT POLLUTION  
AND IMPROVE HEALTH**

# GREEN HEART PROJECT

# CENTRAL HYPOTHESIS

Exposure to neighborhood greenery diminishes the risk of cardiovascular disease by decreasing the levels of air pollution
