

Air Force Civil Engineer Center

**AFCEC Capabilities and
Directions to Advance
Innovative Remediation
Technologies**

Jeffrey Davis, PhD
BAA Program Manager & Remediation
Engineer Specialist

FRTR Spring 2021 Webinar and Meeting May 26, 2021 1

AFCEC

- What are Air Force Restoration BAAs?
 - Implement Innovative Technologies at AF Restoration Sites
 - BAA projects emphasize:
 - Testing, evaluation, demonstration and validation of promising restoration technologies that have emerged from R&D,
 - Field-scale treatability studies, pilot-scale remediation, and upscaling efforts at installations considered to be priority sites, and
 - Objectives and activities that directly support installation needs for innovation in remediation decisions and actions.
- BAA Focus Areas
 - High Resolution Site Characterization (HRSC)
 - PFAS Remediation

FRTR Spring 2021 Webinar and Meeting May 26, 2021 2

AFCEC

- BAA Process
 - Statement of Needs (SON) DataCall—October/November
 - BAA Announcement in BetaSam (formerly FedBizOps)—Feb/Mar
 - Phase 1 Proposal and Down Select-Apr/May
 - Selected Phase 1 proposals “paired” with installations where a BAA project would benefit remediation decisions and actions
 - AFCEC/CZO and AFCEC/CZR participation in “pairing” of BAA proposals with installations
 - Phase 2 Process and Award-Jul/Aug

FRTR Spring 2021 Webinar and Meeting

May 26, 2021

3

AFCEC

- Current Statements of Need
 - Proposals to evaluate, demonstrate and validate innovative technologies for cost effective remediation of media impacted by per- and polyfluoroalkyl substances (PFAS) resulting from the use of Aqueous Film Forming Foam (AFFF) formulations. The primary PFAS-impacted media of concern to the Air Force including **groundwater**, surface water, sediments, and soils.
 - Proposals that focus on demonstration and validation of technologies for characterization of groundwater at sites with complex heterogeneous hydrogeology, specifically Site SS028 at Columbus AFB, MS.

FRTR Spring 2021 Webinar and Meeting

4

AFCEC

- Current PFAS BAA Demonstration Projects
 - Coupling Ion Exchange Resin with Electrochemical Treatment of Regenerant,
 - Absorbents for In-situ Stabilization of PFAS Compounds,
 - Enhanced Contact Electrical Discharge Plasma Reactor for Destruction of PFAS Compounds,
 - Destruction of PFAS Compounds in Nanofiltration Reject Water using UV Oxidative/Reductive Treatment.
- Legacy Issues
 - High Resolution Site Characterization (HRSC) Guidance and Demonstration,
 - Innovative DNAPL Remediation Using High-Resolution Characterization and Low Level Heat.
