- III. Remedial Investigation (RI) Focus
  - TOI Rate Estimation
  - Impact Area Discovery Updates (Formerly called Find Target Areas)
- IV. Grids vs. Transects
- v. Upcoming Classes
- VI. Things not to say as a VSP Expert
- VII. Conclusions & Conversations

### Motivation: New VSP RI Tools & Structure

## Remedial Investigations (RI) projects need more consistently applied sampling designs and tools

- Some inappropriate applications of non-RI VSP modules
- UXO Estimator and VSP were often awkwardly cobbled together (neither tool completely met needs)

#### Solution:

- 1. ESTCP established a VSP-RI advisory group
- 2. RI survey and data evaluation objectives were defined
- 3. Developed new VSP Modules for RI survey design and analysis to clearly address RI objectives

**VSP 7.0** 

- Released March 2014
- New VSP-RI Additions Include
  - ♦ VSP UXO Expert Guide
  - ♦ VSP-RI Sampling Goal Menu Item
    - 3 primary survey design and analysis objectives
  - HTML-based Help Files (also available on <u>vsp.pnnl.gov/help</u>)
  - UXO-Estimator Replacement
- Other new Features added
  - Map tile servers connections
  - Improved graph views

## VSP Workflow Guidance in Expert Mentor

**Objective:** Provide guidance to VSP users on which UXO related module to protect against misuse (>15 module options).

- 1. Developed decision objective flowchart that leads user to the appropriate VSP module
- 2. Created descriptive summaries for each VSP module
- 3. Incorporated work into the VSP-UXO Guide
- 4. Rolled out in VSP 7.0

#### **RI Survey Objectives**

Takes user to impact

area discovery module or

to augment existing

- Three primary objectives identified
- surveys module Remedial Investigation (UXO) Provides options for non-**Bayesian and Bayesian** I need to approaches including UXO Develop a transect survey design where to Estimator equivalent delineate target areas. do not 🔽 use existing transects or fix transects. O Develop a transect survey design to show that the rate of Goes to presumptively pre-specified level (UXO/acre<Z), with no clear target are clean survey module known target areas that have some potential music Develop a transect or grid survey design for presumptively clean area(s) to show I'm X% confident that at least Y% of the area does not contain unacceptable items. OK Cancel

#### **TOI Rate Estimation**

I want to estimate the unacceptable item rate (e.g., MEC/acre) or number of unacceptable items on my site and show that I am confident that it is no more than some value.

| My site is 300 acres   |              |                     |  |
|--|--------------|---------------------|--|
| My sampling unit will be a 1000 by 3 feet 💌 transect.  |              |                     |  |
| I want to demonstrate with 95 % confidence that:   |              |                     |  |
| the true rate of unacceptable items (e.g., MEC/acre) in the site ranges from 0 to no more than     .5  | per acre 💌   |                     |  |
| C the true number of unacceptable items in the entire site ranges from 0 to no more than   |              |                     |  |
| I do not vant to use a Bayesian method to account for prior knowledge about the likelihood of unacceptab   | le items.    |                     |  |
|  | Design       | Survey Acreage      |  |
|  | Non Bayesian | 5.93 (87 transects) |  |
| You must survey 1.98% of the site (5.9322 acres) by taking approximately 87 transects (1000 by 3 feet) and have no unacceptable items found. If no unacceptable items are found, your best estimate of the true rate of unacceptable items is 0 per acre and you can be 95% confident that the true unacceptable item rate is no larger than 0.5 per acre and there are no more than 150 unacceptable items on the entire 300 acre site. |              |                     |  |
| If any unacceptable item is found, then you cannot conclude with 95% confidence that the true rate of<br>unacceptable items is no larger than 0.5 per acre. If unacceptable items are encountered, you can go to the<br>Post-Survey Analysis tab to estimate the unacceptable item rate and confidence interval.   |              |                     |  |
|  |              |                     |  |
|  |              |                     |  |
| If I want to have no more than a 20 % chance of concluding that the true rate of unacceptable  |              |                     |  |
| items (i.e., MEC/acre) is greater than 0.5 per acre, then the true rate of unacceptable items must be equal to<br>or less than 0.04 per acre.  |              |                     |  |

Log Y-Scale

| Post-Surv  | vey Analysis   |
|--|--|
| <ul> <li>Non-Bayesian</li> <li>Data analysis<br/>summaries<br/>provided in<br/>blue</li> </ul> | RI TOI Estimation Transect Placement Cost Post-Survey Analysis<br>My site is 300 acres<br>My sampling unit was a 1000 by 3 feet ransect.<br>I surveyed: 152 % of the site (coverage)<br>67 1000 by 3 foot transects<br>a total of 456 acres<br>and found 1 unacceptable items.<br>I want to demonstrate that I am 95 % confident that:<br>• the true rate of unacceptable items (e.g., MEC/acre) in the site ranges from 0 to no more than 5 per acre<br>C the true number of unacceptable items in the entire site ranges from 0 to no more than 15<br>1 do not v want to use a Bayesian method to account for prior knowledge about the likelihood of unacceptable items.<br>Estimate: |

Your best estimate of the unacceptable rate based on observing 1 unacceptable items and surveying 4.56 acres is 0.2193 per acre.

You can be at least 95% confident that the unacceptable item rate is no larger than 1.037 per acre and there are no more than 311 unacceptable items on your site.

You can be 66.7% confident that the unacceptable rate is no larger than 0.5 per acre and there are no more than 150 unacceptable items.

If you want to show that you are 95% confident that the true rate of unacceptable items is no larger than 0.5 per acre and the total number of unacceptable items is no more than 150, given the fact that you have already encountered 1 unacceptable items, you will need to survey an additional 4.81 acres and find no additional unacceptable items.

#### **Post-Survey Analysis** RI TOI Estimation Transect Placement Costs Post-Survey Analysis My site is 300 acres Bayesian My sampling unit was a 1000 by 3 feet transect Data analysis (i) 1.52 I surveyed: % of the site (coverage) O 67 summaries 1000 by 3 foot transects C a total of 4.56 acres provided in and found 1 unacceptable items. blue I want to demonstrate that I am 95 % confident that: per acre It the true rate of unacceptable items (e.g., MEC/acre) in the site ranges from 0 to no more than .5 -Confidence O the true number of unacceptable items in the entire site ranges from 0 to no more than 150 bounds use want to use a Bayesian method to account for prior knowledge about the likelihood of unacceptable items. priors I want to use an informed prior. (An uninformed prior is equivalent to UXO Estimator). 0.75 ) that the maximum number of unacceptable items on this site is no more than 325 I am quite sure (with probability > There is a lesser chance of having 162 or fewer unacceptable items than there is of having > 162 unacceptable Your best estimate of the unacceptable rate based on observing 1 unacceptable items and surveying 4.56 acres is 0.2193 per acre. You can be at least 95% confident that the unacceptable item rate is no larger than 0.89 per acre and there are no more than 267 unacceptable items on your site. You can be 69% confident that the unacceptable rate is no larger than 0.5 per acre and there are no more than 150 unacceptable items. If you want to show that you are 95% confident that the true rate of unacceptable items is no larger than 0.5 per acre and the total number of unacceptable items is no more than 150, given the fact that you have already encountered 1 unacceptable items, you will need to survey an

additional 4.81 acres and find no additional unacceptable items.

#### **Presumptively Clean**

- Develop a transect or grid survey design for presumptively clean area(s) to show I'm X% confident that at least Y% of the area does not contain unacceptable items.
- Similar methodology to post remediation verification
- Requires the user to define a parcel size of concern

| resumptively Clean Verification Transect Placement Costs and Coverage  |  |  |  |
|--|--|--|--|
| My site is 300.0000 acres  |  |  |  |
| My transects will be 1000 by 3 foot ransect.   |  |  |  |
| My parcel size of concern will be 0.25 acres   |  |  |  |
| With the expectation that no targets of interest (TOI) remain,   |  |  |  |
| I want to survey enough area to state with 90.00 % confidence that:  |  |  |  |
| the percent of parcels that contain TOI ranges from 0% to no more than     5.00 %.   |  |  |  |
| C the number of parcels that contain TOI ranges from 0 to no more than 60  |  |  |  |
| Note that as the parcel size increases, the maximum number of allowed unacceptable parcels decreases and the required survey acreage increases. Parcel sizes that are too small will result in more allowed unacceptable parcels and too little survey acreage. Thus, clear justification for selecting parcel size should be provided (e.g. 1/4 acre home lot size).                    |  |  |  |
| I do want to account for prior belief about likelihood of unacceptable items in my area.   |  |  |  |
| Before any surveying takes place, I expect no more than  |  |  |  |
| 50 (4.17%) of the 1200 total 0.25-acre parcels contain TOI.  |  |  |  |
| You must survey approximately 1.83% of the site (5.50 acres) by surveying 80 (1000 by 3 foot) transects and find no TOI. If no TOI are found, your best estimate of the number of parcels that contain TOI on the site is 0 and you can be 90.00% confident that at least 95.00% of all 1200 parcels do not contain TOI and that there are no more than 60 parcels that may contain TOI. |  |  |  |
| If TOI are found, then you cannot conclude with 90.00% confidence that at least 95.00% of all 1200 parcels do not conta<br>TOI and that there are no more than 60 parcels that may contain TOI.  |  |  |  |

#### Augmented Transects Module

#### I need to

- Develop a transect survey design where target areas are known or suspected to identify and delineate target areas.
  - I do not ▼ want to use existing transects or fix transects.
  - ACOE funded new module for augmenting existing surveys to meet TA detection objective
- Successfully applied on Breezy Hill site
- Added as an option within VSP 7.0

#### Motlow: TOI/Acre Estimation

- Wanted to show 90% confident that TOI/Acre < 0.5</li>
- Used uninformed prior (UXO Estimator equivalent)
- Requested 4.6 acres of transect surveys
- Made reasonable Bayesian prior design as well
- Cleanup of Area 1 where target areas were prevalent, <800 TOI found
- Cost limited demonstration to 2.7 acres of transect surveys
- No TOI found

| Motlow Area 3a: TOI/Acre Analysis 🍥 ESTCP  |  |  |

You can be 91.6% confident that the unacceptable rate is no larger than 0.5 per acre and there are no more than 805 unacceptable items. </li> </ul> |  |  |

#### **Grids vs. Transects**

#### **Grids vs. Transects**

- Using Area 3a boundary, via simulation examined effect of grids vs. transects on actual achieved confidence for TOI/acre estimation
  - varied TOI clustering
  - varied survey unit dimensions

#### **Sample Unit Dimensions (meters)**

- Transects
  - ♦ 1x50, 1x100, 1x500, & 1x1000
  - ♦ 3x50, 3x100, 3x500, & 3x1000
  - ♦ 6x50, 6x100, 6x500, & 6x1000
- •Grids
  - ♦ 50x50, 50x100, & 100x100

#### **TOIs for 5 Rates per Acre**

All survey dimensions met objectives equally well as expected

### Grids vs. Transects

- 16 different levels of clustering were used for Area 3a at 5 different rates
  - ♦ 0.1,
  - ♦ 0.5,
  - 1.0 (picture shown),
  - ♦ 1.5,
  - ♦ 2.0

#### Grids vs. Transects: <12%

Confidence performance: TOI points can lie in no more than 12% of the sample area

### Grids vs. Transects: >90%

Confidence performance: TOI points can lie in greater than 90% of the sample area

### Grids vs. Transects: 23% to 50%

Confidence performance: TOI points can lie in between 23% and 50% of the sample area

#### **Grids vs. Transects Findings**

- Any dimension of surface area sampling is going to have difficulties with tightly clustered TOI (<12%)
  - This is really the area where users should be using impact area discovery designs
- Standard long narrow transects are the most robust to TOI clustering (1 m to 3 m wide)
- Grid sampling is not robust to departures from uniformly distributed TOI (homogeneity)

#### **VSP-UXO Training Courses**

#### Last Course

- Apr 15-16, 2014
- Huntsville

Upcoming

- Exploring multiple locations for FY14-15
  - Planning three for fall/winter
- Late Summer and two in the Winter months
- Contact J. Hathaway with interest to host course

# Top 5 Things not to say when you are supposed to be the VSP-UXO expert

- 1. When asked why you are surveying X% of the site, you say, "I used the VSP".
  - With over 15 UXO based designs and over 50 other designs saying you used "the VSP" is like saying you used "Windows" to do your analysis
- 2. I didn't know that they offered training courses
- 3. It is impossible to know which design to use in VSP
  - With the UXO Guide and improved RI dialogue we hope that even the non-VSP expert can arrive at the correct design
- 4. VSP only has designs for target area discovery
- 5. You tell your boss, "We can't get it the software is too expensive"
  - It is free at vsp.pnnl.gov
