LOQ = Limit of Quantitation
U = Not detected at or above the LOD
H = Out of holding time
B = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
J = Estimated result < LOQ and ≥ DL
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

LOQ = Limit of Quantitation
B = Detected in the method blank
E = Quantitation of compound exceeded the calibration range
DL = Detection Limit
Q = Surrogate failure
U = Not detected at or above the LOD
N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
J = Estimated result < LOQ and ≥ DL
L = LCS/LCSD failure
H = Out of holding time
W = Reported on wet weight basis
LOD = Limit of Detection
S = MS/MSD failure

LOQ = Limit of Quantitation
U = Not detected at or above the LOD
H = Out of holding time
B = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
J = Estimated result < LOQ and ≥ DL
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

LOQ = Limit of Quantitation
U = Not detected at or above the LOD
H = Out of holding time
B = Detected in the method blank
N = Recovery is out of criteria
W = Reported on wet weight basis
E = Quantitation of compound exceeded the calibration range
P = The RPD between two GC columns exceeds 40%
LOD = Limit of Detection
DL = Detection Limit
J = Estimated result < LOQ and ≥ DL
Q = Surrogate failure
L = LCS/LCSD failure
S = MS/MSD failure

LOQ = Limit of Quantitation
DL = Detection Limit
LOD = Limit of Detection

U = Not detected at or above the LOD
J = Estimated result < LOQ and ≥ DL
* = RSD is out of criteria

N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
+ = RPD is out of criteria

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

U = Not detected at or above the LOD
J = Estimated result < LOQ and ≥ DL
* = RSD is out of criteria

N = Recovery is out of criteria
P = The RPD between two GC columns exceeds 40%
+ = RPD is out of criteria

Note: Calculations are performed before rounding to avoid round-off errors in calculated results

# Manual Integration Summary

## Arcadis U.S., Inc.

Lot Number: ZG19017

Project Name: ESTCP Vertebrae

Project Number: 30027244.00004

Where applicable, analytes for which manual integration occurred have been flagged with the following:

| Qualifier | Technical Justification | Qualifier | Technical Justification | Qualifier | Technical Justification |
|---|---|---|---|---|---|
| M-01 | Split peak | M-07 | Low fit | M-13 | Error |
| M-02 | Peak tailing | M-08 | Peak not found | M-14 | Baseline |
| M-03 | Incorrect auto integration | M-09 | Analyte not Identified by the Data System | M-15 | Other |
| M-04 | Poor chromatography | M-10 | Analyte misidentified by the Data System | M-16 | Retention time shift |
| M-05 | Manually assigned peak | M-11 | Invalid integration | M-17 | Shouldering |
| M-06 | Wrong isomer | M-12 | Wrong peak | | |

A summary of instances where manual integration occurred is included below:

| Method | Sample | Run Number | Parameter | Qualifier |
|---|---|---|---|---|
| 1633 | ZG19017-001 | 1 | Perfluorobutanesulfonic acid (PFBS) | M-03 |
| 1633 | ZG19017-001 | 1 | Perfluorobutanoic acid (PFBA) | M-03 |

# Manual Integration Summary

## Arcadis U.S., Inc.

Lot Number: ZG19017

Project Name: ESTCP Vertebrae

Project Number: 30027244.00004

Where applicable, analytes for which manual integration occurred have been flagged with the following:

| Qualifier | Technical Justification | Qualifier | Technical Justification | Qualifier | Technical Justification |
|---|---|---|---|---|---|
| M-01 | Split peak | M-07 | Low fit | M-13 | Error |
| M-02 | Peak tailing | M-08 | Peak not found | M-14 | Baseline |
| M-03 | Incorrect auto integration | M-09 | Analyte not Identified by the Data System | M-15 | Other |
| M-04 | Poor chromatography | M-10 | Analyte misidentified by the Data System | M-16 | Retention time shift |
| M-05 | Manually assigned peak | M-11 | Invalid integration | M-17 | Shouldering |
| M-06 | Wrong isomer | M-12 | Wrong peak | | |

A summary of instances where manual integration occurred is included below:

| Method | Sample | Run Number | Parameter | Qualifier |
|---|---|---|---|---|
| 1633 | ZG19017-010 | 1 | Perfluorobutanoic acid (PFBA) | M-03 |
| 1633 | ZG19017-010 | 1 | Perfluoroheptanesulfonic acid (PFHpS) | M-03 |
| 1633 | ZG19017-010 | 1 | Perfluorohexanoic acid (PFHxA) | M-03 |
| 1633 | ZG19017-010 | 1 | Perfluorononanoic acid (PFNA) | M-03 |
| 1633 | ZG19017-010 | 1 | Perfluorooctanesulfonic acid (PFOS) | M-03 |
| 1633 | ZG19017-010 | 1 | Perfluorooctanoic acid (PFOA) | M-03 |
| 1633 | ZG19017-010 | 1 | Perfluoropentanoic acid (PFPeA) | M-03 |
| 1633 | ZG19017-011 | 1 | Nonafluoro-3,6-dioxaheptanoic acid | M-03 |
| 1633 | ZG19017-011 | 1 | Perfluorobutanesulfonic acid (PFBS) | M-03 |
| 1633 | ZG19017-011 | 1 | Perfluorobutanoic acid (PFBA) | M-03 |
| 1633 | ZG19017-011 | 1 | Perfluoroheptanesulfonic acid (PFHpS) | M-03 |

# Manual Integration Summary

## Arcadis U.S., Inc.

Lot Number: ZG19017

Project Name: ESTCP Vertebrae

Project Number: 30027244.00004

Where applicable, analytes for which manual integration occurred have been flagged with the following:

| Qualifier | Technical Justification | Qualifier | Technical Justification | Qualifier | Technical Justification |
|---|---|---|---|---|---|
| M-01 | Split peak | M-07 | Low fit | M-13 | Error |
| M-02 | Peak tailing | M-08 | Peak not found | M-14 | Baseline |
| M-03 | Incorrect auto integration | M-09 | Analyte not Identified by the Data System | M-15 | Other |
| M-04 | Poor chromatography | M-10 | Analyte misidentified by the Data System | M-16 | Retention time shift |
| M-05 | Manually assigned peak | M-11 | Invalid integration | M-17 | Shouldering |
| M-06 | Wrong isomer | M-12 | Wrong peak | | |

A summary of instances where manual integration occurred is included below:

| Method | Sample | Run Number | Parameter | Qualifier |
|---|---|---|---|---|
| 1633 | ZG19017-020 | 2 | Perfluorononanesulfonic acid (PFNS) | M-03 |
| 1633 | ZG19017-020 | 2 | Perfluorooctanesulfonamide (PFOSA) | M-03 |
| 1633 | ZG19017-020 | 2 | Perfluorooctanesulfonic acid (PFOS) | M-03 |
| 1633 | ZG19017-020 | 2 | Perfluorooctanoic acid (PFOA) | M-03 |
| 1633 | ZG19017-020 | 2 | Perfluoropentanoic acid (PFPeA) | M-09 |
| 1633 | ZG19017-020 | 2 | 13C2-6:2FTS | M-03 |
| 1633 | ZG19017-020 | 2 | 13C2-PFDoA | M-03 |
| 1633 | ZG19017-020 | 2 | 13C8-PFOS | M-03 |
| 1633 | ZG19017-020 | 2 | 13C9-PFNA | M-03 |
| 1633 | ZG19017-020 | 2 | D3-NMeFOSA | M-03 |
| 1633 | ZG19017-020 | 2 | D3-NMeFOSAA | M-03 |
| 1633 | ZG19017-020 | 2 | D5-NEtFOSAA | M-03 |
| 1633 | ZG19017-020 | 3 | 1H,1H,2H,2H-Perfluorodecane sulfonic | M-03 |
| 1633 | ZG19017-020 | 3 | Perfluorobutanesulfonic acid (PFBS) | M-03 |
| 1633 | ZG19017-020 | 3 | Perfluorobutanoic acid (PFBA) | M-03 |
| 1633 | ZG19017-020 | 3 | Perfluoroheptanesulfonic acid (PFHpS) | M-03 |
| 1633 | ZG19017-020 | 3 | Perfluoroheptanoic acid (PFHpA) | M-03 |
| 1633 | ZG19017-020 | 3 | Perfluorohexanesulfonic acid (PFHxS) | M-03 |

# Manual Integration Summary

## Arcadis U.S., Inc.

Lot Number: ZG19017

Project Name: ESTCP Vertebrae

Project Number: 30027244.00004

Where applicable, analytes for which manual integration occurred have been flagged with the following:

| Qualifier | Technical Justification | Qualifier | Technical Justification | Qualifier | Technical Justification |
|---|---|---|---|---|---|
| M-01 | Split peak | M-07 | Low fit | M-13 | Error |
| M-02 | Peak tailing | M-08 | Peak not found | M-14 | Baseline |
| M-03 | Incorrect auto integration | M-09 | Analyte not Identified by the Data System | M-15 | Other |
| M-04 | Poor chromatography | M-10 | Analyte misidentified by the Data System | M-16 | Retention time shift |
| M-05 | Manually assigned peak | M-11 | Invalid integration | M-17 | Shouldering |
| M-06 | Wrong isomer | M-12 | Wrong peak | | |

A summary of instances where manual integration occurred is included below:

| Method | Sample | Run Number | Parameter | Qualifier |
|---|---|---|---|---|
| 1633 | ZG19017-027 | 3 | Perfluorobutanesulfonic acid (PFBS) | M-03 |
| 1633 | ZG19017-027 | 3 | Perfluorobutanoic acid (PFBA) | M-03 |
| 1633 | ZG19017-027 | 3 | Perfluoroheptanoic acid (PFHpA) | M-03 |
| 1633 | ZG19017-027 | 3 | Perfluorohexanesulfonic acid (PFHxS) | M-03 |
| 1633 | ZG19017-027 | 3 | Perfluorohexanoic acid (PFHxA) | M-03 |
| 1633 | ZG19017-027 | 3 | Perfluorononanoic acid (PFNA) | M-03 |
| 1633 | ZG19017-027 | 3 | Perfluorooctanesulfonic acid (PFOS) | M-03 |
| 1633 | ZG19017-027 | 3 | Perfluorooctanoic acid (PFOA) | M-03 |
| 1633 | ZG19017-027 | 3 | Perfluoropentanesulfonic acid (PFPeS) | M-03 |
| 1633 | ZG19017-028 | 1 | Perfluorobutanesulfonic acid (PFBS) | M-03 |
| 1633 | ZG19017-028 | 1 | Perfluorononanoic acid (PFNA) | M-03 |

# Manual Integration Summary

## Arcadis U.S., Inc.

Lot Number: ZG19017

Project Name: ESTCP Vertebrae

Project Number: 30027244.00004

Where applicable, analytes for which manual integration occurred have been flagged with the following:

| Qualifier | Technical Justification | Qualifier | Technical Justification | Qualifier | Technical Justification |
|---|---|---|---|---|---|
| M-01 | Split peak | M-07 | Low fit | M-13 | Error |
| M-02 | Peak tailing | M-08 | Peak not found | M-14 | Baseline |
| M-03 | Incorrect auto integration | M-09 | Analyte not Identified by the Data System | M-15 | Other |
| M-04 | Poor chromatography | M-10 | Analyte misidentified by the Data System | M-16 | Retention time shift |
| M-05 | Manually assigned peak | M-11 | Invalid integration | M-17 | Shouldering |
| M-06 | Wrong isomer | M-12 | Wrong peak | | |

A summary of instances where manual integration occurred is included below:

| Method | Sample | Run Number | Parameter | Qualifier |
|---|---|---|---|---|
| 1633 | ZQ16118-102 | 1 | 1H,1H,2H,2H-Perfluorodecane sulfonic | M-03 |
| 1633 | ZQ16118-102 | 1 | 1H,1H,2H,2H-Perfluorohexane sulfonic | M-03 |
| 1633 | ZQ16118-102 | 1 | 1H,1H,2H,2H-Perfluorooctane sulfonic | M-03 |
| 1633 | ZQ16118-102 | 1 | 2H,2H,3H,3H-Perfluorooctanoic acid | M-03 |
| 1633 | ZQ16118-102 | 1 | Hexafluoropropylene oxide dimer acid | M-03 |
| 1633 | ZQ16118-002 | 1 | N-ethyl | M-03 |
| 1633 | ZQ16118-102 | 1 | N-ethyl | M-03 |
| 1633 | ZQ16118-001 | 1 | N-ethyl | M-03 |
| 1633 | ZQ16118-102 | 1 | N-methyl perfluorooctanesulfonamide | M-03 |
| 1633 | ZQ16118-002 | 1 | N-methyl | M-03 |
| 1633 | ZQ16118-102 | 1 | N-methyl | M-03 |
| 1633 | ZQ16118-001 | 1 | N-methyl | M-03 |
| 1633 | ZQ16118-102 | 1 | Nonafluoro-3,6-dioxaheptanoic acid | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluoro(2-ethoxyethane)sulfonic acid | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluoro-3-methoxypropanoic acid | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluoro-4-methoxybutanoic acid | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluorobutanesulfonic acid (PFBS) | M-03 |
| 1633 | ZQ16118-002 | 1 | Perfluorobutanoic acid (PFBA) | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluorobutanoic acid (PFBA) | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluorodecanoic acid (PFDA) | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluoroheptanesulfonic acid (PFHpS) | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluoroheptanoic acid (PFHpA) | M-03 |
| 1633 | ZQ16118-001 | 1 | Perfluorohexanesulfonic acid (PFHxS) | M-03 |
| 1633 | ZQ16118-002 | 1 | Perfluorohexanesulfonic acid (PFHxS) | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluorohexanesulfonic acid (PFHxS) | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluorohexanoic acid (PFHxA) | M-03 |
| 1633 | ZQ16118-102 | 1 | Perfluorononanoic acid (PFNA) | M-03 |

# APPENDIX D HYDRAULIC TESTING ANALYSIS MEMORANDUM – SLUG TESTING

# Memo

**SUBJECT**
Hydraulic Testing Analysis
Grayling Army Airfield, Michigan

**DATE**
July 27, 2023

**DEPARTMENT**
Environment

**NAME**
Everett Fortner III, PG
Arcadis US

# Introduction

Hydraulic testing activities were performed in 2021 and 2022 at the Grayling Army Airfield located in Crawford County, Michigan to evaluate hydraulic conditions within the shallow groundwater system. The hydraulic response data was further used to evaluate potential skin effects (degree of hydraulic connection) within the Vertebrae™ well screen intervals and to support separate modeling evaluations. Details regarding the hydrogeologic conditions and additional overarching objectives are provided in the main report.

# Methods

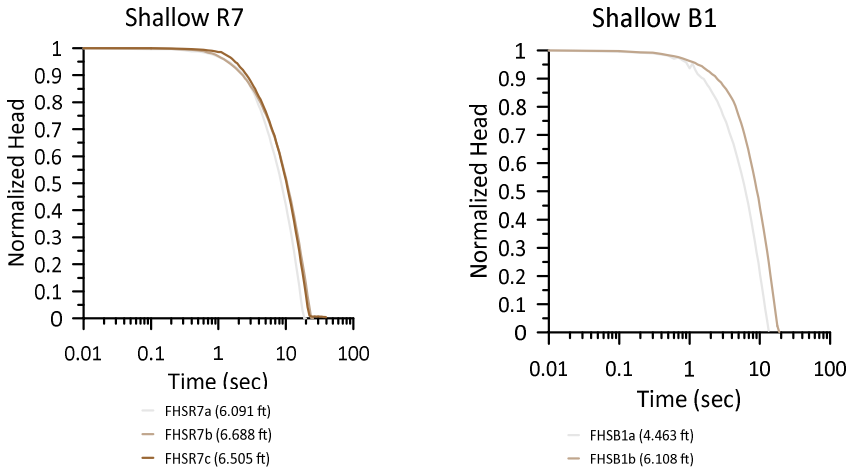
The hydraulic testing consisted of localized low stress slug testing by varying methodologies:

- Vertical Aquifer Profiling (VAP) Slug Testing: During vertical aquifer profiling activities and hydraulic profile tool advancement (HPT), testing was completed in September 2021 at select temporary screen intervals with the pneumatic slug testing method. The testing was within three vertical boreholes VAP-VRTB-02/03/04 at four to five intervals each that range in mid-screen depth from 21.3 to 38.3 feet below ground surface (ft bgs).
- Vertical Monitoring Well Slug Testing: Monitoring wells installed based on the VAP profiling results were tested with solid and pneumatic slug testing methods. The testing at five wells have mid-screen depths ranging from approximately 17.5 to 18.5 ft bgs at MW-01S/02S/03 within the shallower portion of the groundwater zone and at approximately 28.5 ft bgs within the deeper portion.
- Horizontal (Vertebrae™) Well Slug Testing: individual isolated horizontal well screens within the shallow (B1, S2, Y3, G4, M5, O6, R7, P8) and deep (B1, S2, Y3, G4, M5, O6, R7, P8) transects were tested using the inflow (falling head) method. Select deep transect intervals (M5, O6, R7, P8) were also testing using the pneumatic slug testing method.

Pneumatic slug tests were completed by pressuring the water column with a manifold system using two differing pressures. The pressurized headspace was estimated with a head space pressure gauge, however, the equalized pressure recorded by the pressure transducer (higher accuracy) was used for the maximum displacement estimate. Solid slug tests were initiated with a PVC rod of known diameter and length. Inflow tests were initiated by inducing a volume of water down the horizontal well casing.

Multiple slug tests were completed at each location. The theoretical displacement was calculated for the solid slug testing and used for comparison to the actual displacements. Due to the gauge inaccuracy with the pneumatic slug tests and the delayed responses for the inflow tests, a comparison of a theoretical to an actual displacement was not feasible.

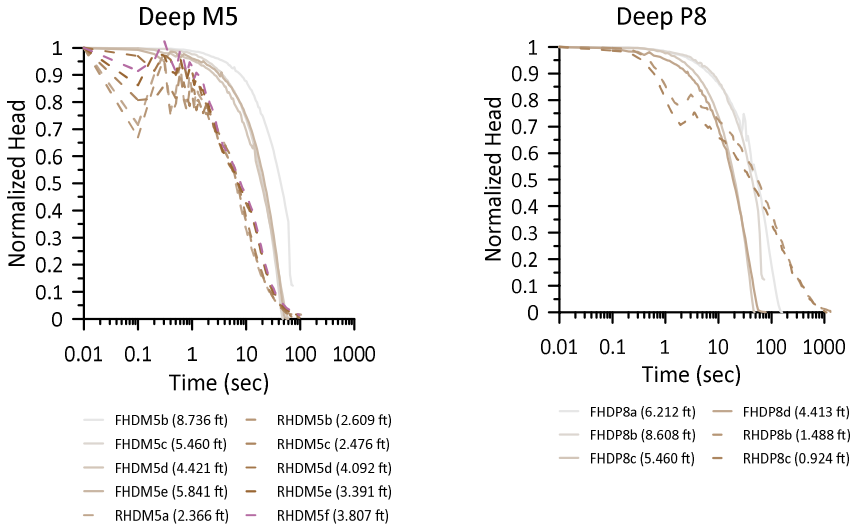
The water level responses for the slug tests were recorded using a pressure transducer at a fine interval of 0.1 to 0.25 seconds. The recorded data was processed by selecting the maximum displacement or in the cases of initiation noise, the most representative maximum displacement during the test initiation. The recovery displacement data was further processed to improve the efficiency with analysis by retaining the high frequency data for the early time portion and reducing the frequency for the mid to late time portions of each test. The recovery response curves were charted and utilized in a recovery response evaluation to compare the responses that have varying displacements for head dependency (differing recovery time with differing displacement) for the horizontal well tests. The testing data was further screened for quality and usability based on the level of test noise or recovery response. The test(s) with the least amount of noise was used for hydraulic parameter analysis using applicable analytical solutions with AQTESOLV® for Windows© (Duffield, 2007) following guidance in Butler, 2019.



# Recovery Response Evaluation

Comparing normalized recovery responses is a diagnostic tool to verify slug test theory and duplicity of tests; thereby, increasing data quality and evaluation potential of the results (Butler, 2019). The success of low stress hydraulic testing is directly related to the well screen degree of hydraulic connection with the groundwater zone. When hydraulic communication is diminished by well design characteristics or groundwater zone damage caused by drilling methodology that is not mitigated by some degree with development, the hydraulic response is affected. This local diminished hydraulic communication is referred to as a skin effect.

Duplicate slug tests with similar or varied head displacement should approximately coincide in recovery response. The repeat slug test data for the horizontal well screens tested are summarized in a series of normalized displacement charts provided in **Attachment 1**. The testing descriptions are abbreviated as FH (falling head – inflow test) or RH (rising head – pneumatic).



The shallow transect wells were completed by inflow methods with similar displacements for the multiple tests except for B1 and R7. The response curves for similar displacements generally coincide and confirms test method quality and reproducibility. The two intervals with differing displacements show temporal response differences. It is expected that if there are skin effects present, response with larger displacements will have longer recovery time in comparison to smaller displacements, demonstrating a degree of head dependency and skin effects. The skin effects may be potentially caused by local groundwater zone damage or the well design consisting of high-density polyethylene (HDPE) screen wrapped in 88 micron geotextile filer material. The response curves from shallow B1 and R7 correlate to this principle with a longer recovery time for the larger displacement (**Exhibit 1**).

**Exhibit 1**. Normalized response curves for shallow transect B1 and R7 that demonstrates head dependency from skin effects.

The deep transect wells were also mostly completed by inflow methods. Four well screens were additionally tested with pneumatic methods (M5, O6, R7, and P8). As with the shallow transect, the tests with similar displacements for the multiple FH tests have comparable responses. The well intervals with differing FH displacements both show generally consistent recovery time and differing recovery time. The consistent recovery time suggests the skin effects are likely not present. The wells screens M5 and P8 with temporal differences in recovery demonstrate head dependency. Pneumatic slug tests, RH, responses have observed early time test noise, differing recovery curve displacement relationship with time compared to the FH, and comparable response times with similar and differing displacements. The recovery curve differences with the two types of tests, FH and RH, may indicate that skin effects have a more pronounced effect with infiltration into the well screen, FH, in comparison to exfiltration with the RH that do not appear to have a clear head dependency. The response curves from deep M5 and P8 with FH and RH tests are shown below as **Exhibit 2**.

**Exhibit 2**. Normalized response curves for deep transect M5 and P8 that demonstrate head dependency from skin effects for FH tests and comparable responses for RH tests.

# Hydraulic Parameter Analysis

The response data for the VAP temporary screen intervals, vertical monitoring wells, and the horizontal well screen intervals were evaluated to estimate hydraulic parameters. The analysis solution reports are provided as **Attachment 2**. The results are also provided in summary tables **Table 1** through **3**, with testing details for the VAP, vertical monitoring wells, and horizontal wells, respectively.

The VAP temporary well screen testing was completed with pneumatic methods. The hydraulic conductivity estimates are consistent with a tight range from 1.0E-02 centimeters per second (cm/sec) to 4.8E-02 cm/sec. The hydraulic conductivity estimate generally correlates to the grain size descriptions. In addition, a weak correlation is present with increasing hydraulic conductivity with depth of the temporary screen.

The vertical monitoring well testing was completed by both solid and pneumatic methods. As with the VAP hydraulic testing results, the vertical monitoring well hydraulic conductivity estimates have a tight range from 1.9E-02 cm/sec to 5.2E-02 cm/sec and correlate to the grain size descriptions. The vertical monitoring wells also have a weak correlation with increasing hydraulic conductivity with depth.

The horizontal well testing was completed by inflow and pneumatic methods. Note that the horizontal well analysis involved applying physical dimensions for the horizontal well to best align with a traditional vertical well for applicability to the chosen solution analysis assumptions (**Table 3**). The results also have a tight range of hydraulic conductivity estimates from 1.0E-03 cm/sec to 6.0E-03 cm/sec and a similar weak correlation with increasing mean hydraulic conductivity with depth (1.9E-03 cm/sec with the shallow transect in comparison to 2.7E-03 with the deep transect). Importantly, the horizontal well test solution results are an order of magnitude less compared to the VAP and vertical wells and have implausibly low specific storage estimates. These responses are consistent with a skin effect response, which may be the result of the screen efficiency and geotextile fabric wrap used in the Vertebrae well construction. As such, the hydraulic conductivity values estimated from the horizontal wells are not considered reliable.

# Summary

The hydraulic testing implementation and analysis for the VAP, vertical monitoring wells, and horizontal well screens have provided increased insights with the Vertebrae™ design and the shallow groundwater zone hydraulic conductivity distribution. The evaluation of recovery responses, order of magnitude less hydraulic conductivity, and the implausibly low specific storage for the horizontal wells suggest likely skin effects are present.

To further compare hydraulic conductivity estimates for the shallow groundwater zone, the hydraulic conductivity results presented were combined with single well tracer test and grain size analysis from separate results. The combined results were charted by mid-screen or mid-interval collection depth in ft bgs versus hydraulic conductivity (cm/sec) on a log scale (**Exhibit 3**). The VAP temporary screen interval results are labeled as pore pressure dissipation tests with the HPT borings.

The significant lower hydraulic conductivity estimates for the horizontal wells are apparent and considered biased low and unreliable.  The grain size analysis results are consistently higher than all other estimates and likely indicate a high bias. The estimates from the other methods fall between the two end members with a few outliers present for the single well tracer test results. The results from the in-situ methods suggest a possible slight

correlation with increasing hydraulic conductivity with depth; however, a depth correlation for the grain size analysis results is not apparent.

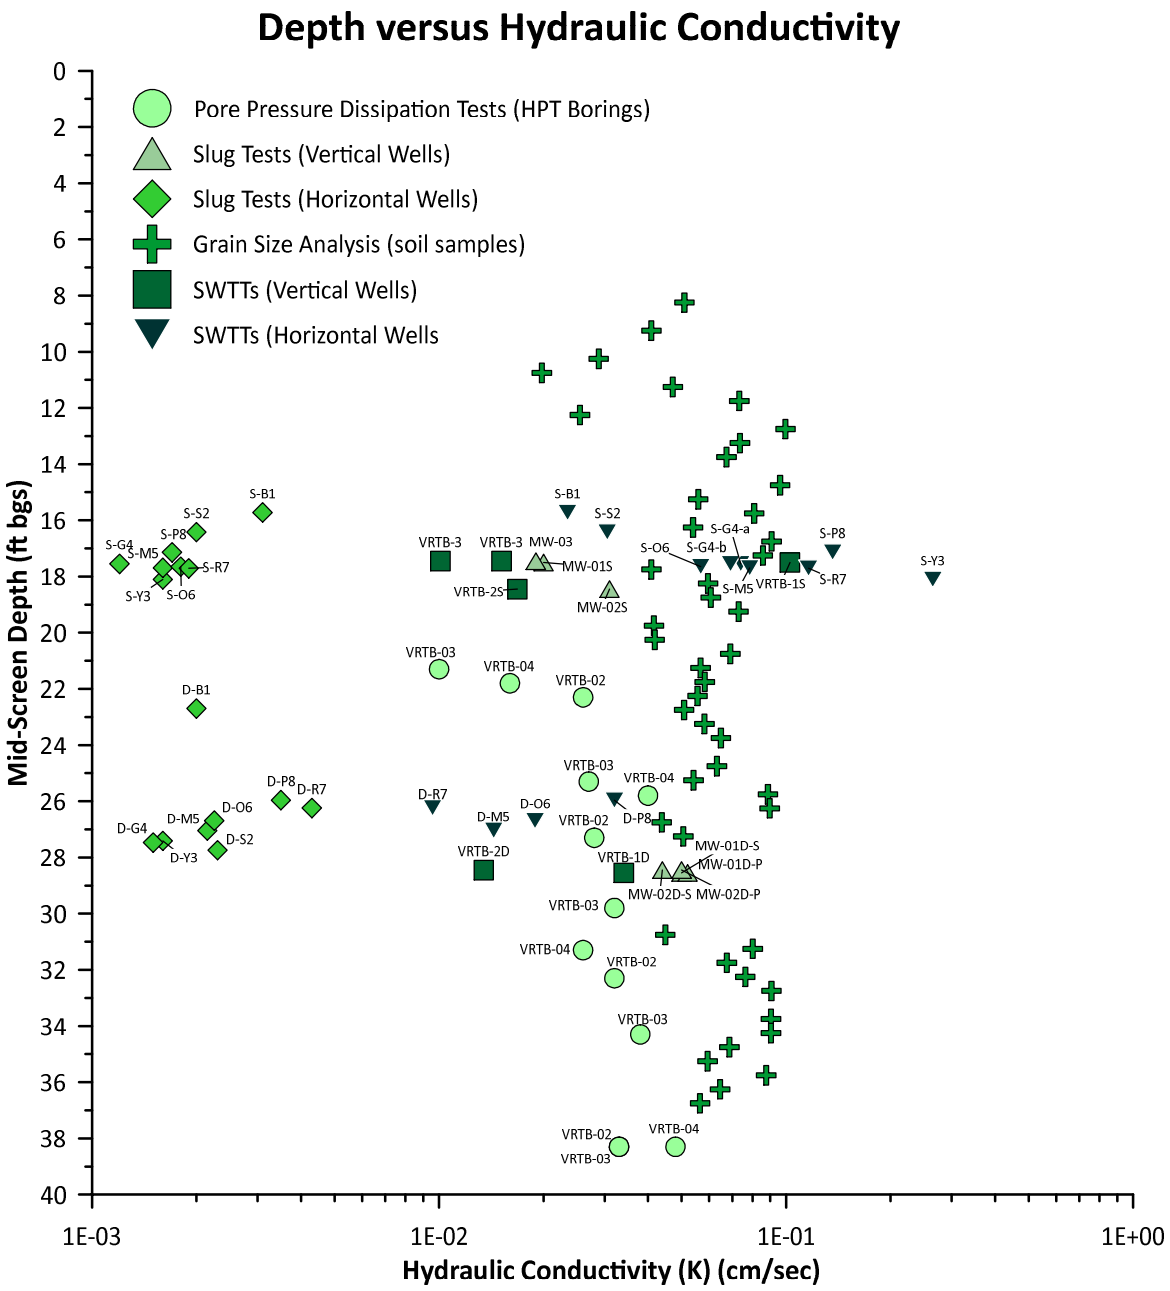


**Exhibit 3**. Semi-log chart of hydraulic conductivity estimates with depth from multiple analysis results.

**Notes**

ft bgs = feet below ground surface
cm/sec = centimeters per second
-- not applicable

[1] Saturated thickness and water column assumed to be at least 10 feet (equal to horizontal screen length and localized influence near well).

[2] Inflow (falling head) slug test completed by inducing water. Resulting recovery was not instantaneous and demonstration compared to rising head tests (pneumatic) performed in some of the deep well screens suggest an effect of well skin reducing the hdyraulic connectivity with the formation. The curve match with implausibly low Ss (well skin) was best estimated by matching with curve crossing 0.7 normalized head displacement.

[3] Three to five inflow tests were completed with introducing water to the well. Six pneumatic tests were completed at DM5, DO6, DR7, and DP8 at two differing pressures (approximately 30 and 50 inches of water pressure); actual test response pressure head differs and likely due to pressure gauge inaccuracy. Test responses were reviewed and test with least amount of noise was chosen for curve matching. Test responses were also evaluated for head dependency; three tests completed with pneumatic methods at two differing displacements totaling six tests per well; test with least amount of noise used for hydraulic conductivity estimate.

Remarks: Multi-level CMT well with 7 ports installed at SB-VRTB-03; CMT well ID is CMT-VRTB-01, port IDs are CMT-VRTB-01_1 through CMT-VRTB-01_7. All ports are accessible from a central location in a flush mount; ports are labeled (port 7 is in the center). Use 1/4" tubing for groundwater sampling; a small diameter WLM may fit down select port access tubing.

# APPENDIX F GRAIN SIZE ANALYSES AND HYDRAULIC CONDUCTIVITY ESTIMATES

# Appendix F

# Grain Size Analyses and Hydraulic Conductivity Estimates

## Introduction

During sonic coring at "golden spike" borehole SB-VRTB-03 a total of 50 samples were collected for grain size analyses in 100mL specimen jars over the depth interval from 8.0 – 37.0 ft bgs (**Table 1**). These were subjected to grain size analyses and subsequently the grain size distributions used to estimate hydraulic conductivity based on different empirical models presented in Devlin (2015).

## Methods

The samples collected in specimen jars were split via a quartering process and any larger cobbles removed that could skew the results. The split samples were then oven-dried providing dry sample masses between 54.0-136.1 g (average of 90.8 g) to be subjected to analysis. Samples were then wet-sieved through a #200 sieve (0.074mm) and dried again to provide the mass of fines (silt and clay sized particles). The remaining material was then dry-sieved through a series of 16 sieves (**Table 2**) using a mechanical shaker (**Figure 1**). Samples from each sieve were then weighed and the cumulative mass recovered compared with the initial dry sample mass after wet-sieving as a quality control check. Hydrometer analyses were not conducted on the fine fraction.

## Grain Size Results

Grain size distribution curves for all of the samples are plotted together in **Figure 2** showing ranges of grain size for gravel (>2 mm) and coarse – medium – fine sand (2.0 to 0.063mm) and silt / clay (<0.063mm). Split samples were also analyzed by a contract lab as well as samples from other boreholes using a sparser sieve-set. **Figure 3** shows a comparison of grain size distribution curves between the two analyses.

## Hydraulic Conductivity Estimates

An Excel based tool HydroGeoSieveXL (Devlin, 2015) was used to estimate hydraulic conductivity for samples based on the grain size distribution curves. Fifteen different estimation methods are used in the tool and produce a range of estimates; several of the methods have a range of applicable conditions. **Figures 4 and 5** show example reports of results of the grain size curves and hydraulic conductivity estimates, respectively, using the publicly available version of the Excel Tool: https://kuscholarworks.ku.edu/handle/1808/21763. Arcadis also has a proprietary version of the code with additional automation of the process.

# APPENDIX G VERTEBRAE WELL SYSTEM PFAS MATERIALS TESTING

July 7, 2023

Craig Divine PG, PhD
Principal Hydrogeologist, Vice President
Arcadis U.S., Inc.
320 Commerce, Suite 200 | Irvine, CA | 92602 | USA
M +1 720 308 5367

**RE: Results of Vertebrae Well System PFAS materials testing**

Greetings Mr. Divine,

EN Rx, Inc. is pleased to report the following background, methodology, and results from our PFAS compounds testing of the Vertebrae® Well System (VWS) materials in support of ESTCP project ER20-5026.

## Background

VWS were proposed to be utilized for PFAS compounds sampling at Grayling Army Airfield. To address the PFAS contaminants of concern EN Rx developed a testing protocol for the materials utilized in the construction of the VWS. This is intended to verify that the materials used in the VWS do not present the potential to affect groundwater sample quality. The primary mechanisms for the potential impacts would be leaching PFAS from the well materials resulting in increased groundwater concentrations reported. Laboratory-based experiments were completed and focused on key VWS components for these purposes. Laboratory Analysis was limited to the 28 primary PFAS compounds commonly quantified by USEPA Method 537.1.

## Initial Sample Collection and Analysis

Six initial "coupon" size samples, one from each of the well materials, were collected. These coupons were a small portion of all materials used in the general construction of the well systems. These materials are:

- polyester geotextile screen wrap (sock)
- tie-nylon wrap (plastic tie wraps)
- well screen-polyethylene (proprietary product design)

- nylon pull tape measure, printed (also known as Ribbon of Mule Tape)
- riser-HDPE tubing ½" (we also use ¾", 1", 1.25", and 1.5: risers from the same manufacturer )
- sleeve-HDPE 3" (Conduit – SDR 13.5 (we also use 4"and 5" sleeves)

These samples were collected on July 17, 2019, by trained technicians from new stock, using PFAS free gloves, clean cuttings tools, and individual bags. The bags were placed in a box and shipped to the chosen analytical laboratory.

Samples of the six well materials were initially tested at Eurofins Laboratories, Lancaster PA, and established baseline values for the 28 PFAS compounds as solids requiring methanol extraction. The laboratory reports are included as **Appendix A**. The complete lists are reported on the report. Analytical results of the initial testing identified four PFAS compounds above laboratory detection limits associated with the nylon pull tape, tie wrap and the geotextile fabric (polyester sock). Laboratory analytical results indicated the presence of 6:2-Fluorotelomersulfonic acid, 4:2-Fluorotelomersulfonic acid, Perflouroheptanesulfonic acid, Perfluorohexanoic acid, and Perfluoropentanoic acid. Primarily, the main exceedance observed above the laboratory detection limit was centered around a single compound 6:2-Fluorotelomersulfonic (FTS) acid at 2000 ng/g (nanogram/gram) which was several magnitudes above the other constituents, which were reported at trace concentrations 3.9, 0.18, 0.33, and 0.20 ng/g, respectively. Laboratory results are summarized for 6:2 FTS in **Table 1**.

Due to the detection of 6:2 FTS in three of the coupon samples a pre-cleaning procedure was designed to remove the COCs. The pre-cleaning protocol involved three sequential rinses with 1-liter of methanol per rinse. The samples were allowed to dry in open air, and then were bagged as before. Following the pre-cleaning protocol, a second set of samples, for the geotextile sock, the nylon pull tape, and the tie wrap, were collected on September 5, 2019 and shipped to Eurofins Laboratories, Lancaster PA for laboratory analysis.

Laboratory results from the post cleaning indicated excellent removal of the 6:2 FTS. Laboratory results are included as **Appendix B.** All 28 compounds were non-detect for the geotextile sock and the tie wrap. There was one trace detection of Perfluorooctanesulfonic acid (PFOS) at 0.77 ng/g. This was unexplained as the compound was not previously detected in the baseline sampling could have been cross contamination from another source.

Based on the non-detect analytical results of the pre-cleaned samples for the initially detected compounds, it was determined that the pre-cleaning protocol of the VWS well materials successfully addressed the identified PFAS compounds and this method was utilized for the field system deployed at Grayling Army Airfield (GAFF).

**Table 1**

PFAS Free Test Results for 6:2-Fluorotelomersulfonic acid

| VWS Well Material Component | Initial Sampling Results | Post Pre-Cleaning Results |
|---|---|---|
| Sleeve-HDPE 3” | ND | ND |
| Tie-Nylon Wrap | 73 ng/g | ND |
| Gotextile Screen Wrap Sock | 2000 ng/g | ND |
| Riser-HDPE Tubing 1/2 | ND | ND |
| Well Screen-Polyethylene Proprietary Design | ND | ND |
| Nylon Pull Tape Measure- Printed* | 1600 ng/g | ND |

*ND = Non-detect - ng/g (nanogram/gram) - * Subsequently this product was removed from the build for this project.*

**Normal Wash Characteristics**

Due to the analytical results provided in the initial sampling VWS material testing, it is understood there may be PFAS compounds on the geotextile and the pull tape. However, to determine if these PFAS compounds would regularly dissolve off of the geotextile and end up as a reported concentration in collected groundwater samples, a simple rinsate sample was completed.

This test was completed with a geotextile sample submitted to AEL Jacksonville. This sample was rinsed with deionized water. This rinse was sampled using groundwater sampling protocol. The laboratory report is provided in **Appendix C**.

Results indicated that Perfluorooctanoic Acid (PFOA) did rinse into the water at 0.97 ng/g. No other compounds were above the detection limits. See the AEL laboratory report and sample labeled Sock Rinsate DI H2O, collected January 06, 2023.

This PFOA is believed to be cross contamination as it was not detected in the more rigorous method extraction procedure, reported above from initial coupon samples.

Also, the results appear to indicate despite the concentrations detected initially on the geotextile for 6:2 FTS, it is unlikely this compound readily is removed with water and likely to be a reported byproduct of normal geotextile installation.

**Well System Construction Changes**

The well system construction proceeded given the laboratory results and the additional testing which demonstrated that the compounds would not leach by water alone. A successful precleaning procedure was completed for the geotextile and zip ties. However, the nylon pull tape integrated into the system is a tightly woven fabric not as amenable to rising (washing) as the geotextile sock and tie wraps. It also accounted for the laboratory result of Perfluorooctanesulfonic acid (PFOS) post pre-cleaning. For the purposes of this installation for ESTCP, a tracer was to be utilized for locating the well system. ProTrace® wire has markings on it to allow for the measuring of the wells system and thus the measuring tape was not needed and was removed from the well system.

With the above changes three VWS were constructed from October 4, 2021 to October 7, 2021 using cleaned geotextile and tie wraps, tracer wire, and the typical construction sleeve, screen and riser. The wells were shipped to the site and installed.

**Positive Bias Analytical Sampling**

The well materials were also submitted for a positive bias testing. The main well material of suspected ability to positively bias the groundwater sampling is the geotextile fabric. This material was sent to AEL in Jacksonville Florida for analytical laboratory testing.

The protocol for this analysis was to pre-sample the geotextile for PFAS to ensure PFAS concentration was known prior to the testing. The geotextile was prewashed with methanol to ensure a lack of PFAS before testing. The sample did not have any detectable PFAS compounds tested for at the detection limits of the sample. See the AEL lab report and sample labeled sock, collected January 06, 2023.

Then the geotextile was soaked in a PFAS spike solution for 72 hrs to allow for adsorption or adhesion. This solution consisted of the compounds listed on Page 14 of the report (spiked compounds). Then the sock was rinsed three times in deionized water. Finally, the sock was resampled for PFAS compounds using standard solids (soil) methodology. The following results were reported after this this process.

**Table 2**
PFAS Test Results for Positive Bias

| Compound | Result | Unit |
|---|---|---|
| FOSA | 4.5 – i | ppt |
| PFTeDA | 47 | ppt |
| PFTrDA | 13 | ppt |

Three components appear to have an adsorptive capability with the geotextile fiber; FOSA – Perflourooctanesulfonamide (PFOSA), PFTrDA, and PFTeDA. PFTeDA reported the most effect. The FOSA has the least detectable effect. It should be noted these compounds required methanol (solvent) extraction to remove them from the geotextile, so it is unknown if this phenomena would occur in-situ, but it is clear that some PFAS compounds will be more adsorptive than others and could have this effect.

**Conclusions**

The current construction of Vertebrae Well Systems includes in part, material that are likely coated in a PFAS related compound resulting in 6:2 FTS concentration in samples collected from the construction materials (measuring ribbon, geotextile sock, and nylon tie wraps). The tape measure can be removed from the process and the sock and tie wrap can be thoroughly cleaned. Based on the data collected in this study, the VWS well systems can be tested prior to production for certification to be free of primary PFAS type analytes.

It is believed the well material cleaning process is unnecessary given the lack of PFAS compounds that would easily be dissolved into groundwater based on the rinsate sampling. Methanol extraction is aggressive and doesn't represent general groundwater chemistry. However, this can be completed as protocol based on client requirements.

Positive bias testing also reported compounds that can adhere/adsorb and withstand the normal water washing that may occur at sites allowing for the possibility of positive biased sampling of three PFAS compounds. However, no further study was conducted, and these three compounds were not reported at applicable levels at the site.

Thank you for the opportunity to complete this testing and work on the project. Please let us know if there are any questions or concerns.

Sincerely,
**The EN Rx Team**

Lance I. Robinson

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standards is outside of QC acceptance limits as noted on the QC Summary.

The recovery for labeled compound used as extraction standards is outside of QC acceptance limits in the method blank and Laboratory Control Sample Duplicate (LCSD) as noted on the QC Summary.

Z=The response for a target analyte(s) in the closing continuing calibration verification standard is outside the QC acceptance limits. Since the response is high indicating increased sensitivity, and the target analyte(s) is not detected in the sample, the data is reported.

The inital weight of the sample was 230.63 grams.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for labeled compound used as extraction standards is outside of QC acceptance limits as noted on the QC Summary.

The recovery for labeled compound used as extraction standards is outside of QC acceptance limits in the method blank and Laboratory Control Sample Duplicate (LCSD) as noted on the QC Summary.

Z=The response for a target analyte(s) in the closing continuing calibration verification standard is outside the QC acceptance limits. Since the response is high indicating increased sensitivity, and the target analyte(s) is not detected in the sample, the data is reported.

The inital weight of the sample was 234.26 grams.

# Quality Control Summary

Client Name: ENRX, Inc. Group Number: 2055933
Reported: 08/09/2019 13:51

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

REVISED

# Quality Control Summary

Client Name: ENRX, Inc. Group Number: 2055933
Reported: 08/09/2019 13:51

## Labeled Isotope Quality Control (continued)

Labeled isotope recoveries which are outside of the QC window are confirmed unless otherwise noted on the analysis report.

Analysis Name: 28 PFAS in Soil
Batch number: 19214009

Limits: 16-113

*- Outside of specification
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.

# PFOA PFOS Analysis

9-14578
G-2055933
S-1112177-82

1 Sleeve - HDPE 3"
1 Tie - Nylon tie wrap
1 Sock - Polyester geotextile
1 Riser - HDPE Tubing 1/2"
1 Screen - PE Corregated
1 Tape - Nylon pule mule tape printed

# Explanation of Symbols and Abbreviations

*The following defines common symbols and abbreviations used in reporting technical data:*

| | | | |
|---|---|---|---|
| **BMQL** | Below Minimum Quantitation Level | **mL** | milliliter(s) |
| **C** | degrees Celsius | **MPN** | Most Probable Number |
| **cfu** | colony forming units | **N.D.** | non-detect |
| **CP Units** | cobalt-chloroplatinate units | **ng** | nanogram(s) |
| **F** | degrees Fahrenheit | **NTU** | nephelometric turbidity units |
| **g** | gram(s) | **pg/L** | picogram/liter |
| **IU** | International Units | **RL** | Reporting Limit |
| **kg** | kilogram(s) | **TNTC** | Too Numerous To Count |
| **L** | liter(s) | **µg** | microgram(s) |
| **lb.** | pound(s) | **µL** | microliter(s) |
| **m3** | cubic meter(s) | **umhos/cm** | micromhos/cm |
| **meq** | milliequivalents | **MCL** | Maximum Contamination Limit |
| **mg** | milligram(s) | | |

| | |
|---|---|
| **<** | less than |
| **>** | greater than |
| **ppm** | parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas. |
| **ppb** | parts per billion |
| **Dry weight basis** | Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis. |

**Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.**

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

**WARRANTY AND LIMITS OF LIABILITY** - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

# Data Qualifiers

| Qualifier | Definition |
|---|---|
| C | Result confirmed by reanalysis |
| D1 | Indicates for dual column analyses that the result is reported from column 1 |
| D2 | Indicates for dual column analyses that the result is reported from column 2 |
| E | Concentration exceeds the calibration range |
| K1 | Initial Calibration Blank is above the QC limit and the sample result is ND |
| K2 | Continuing Calibration Blank is above the QC limit and the sample result is ND |
| K3 | Initial Calibration Verification is above the QC limit and the sample result is ND |
| K4 | Continuing Calibration Verification is above the QC limit and the sample result is ND |
| J (or G, I, X) | Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL) |
| P | Concentration difference between the primary and confirmation column >40%. The lower result is reported. |
| P^ | Concentration difference between the primary and confirmation column > 40%. The higher result is reported. |
| U | Analyte was not detected at the value indicated |
| V | Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference. |
| W | The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L. |
| Z | Laboratory Defined - see analysis report |
| B | Detection in the Blank |
| Q0 | LCS/LCSD Low |
| Q1 | LCS/LCSD High |
| Q2 | MS/MSD Low |
| Q3 | MS/MSD High |
| Q7 | LCS/LCSD RPD |
| Q8 | DUP RPD |
| Q9 | MS/MSD RPD |

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

| 14027 | Perfluoroundecanoic acid[1] | 2058-94-8 | < 0.50 | 0.50 | 0.17 | 1 |

The stated QC limits for this matrix should be considered advisory.

The initial weight of this sample was 236.6 grams.

## Sample Comments

PA DEP Lab Certification ID 36-00037, Expiration Date: 1/31/20.

[1] = This analyte was not on the laboratory's PA DEP Scope of Accreditation at the time of analysis.

# Quality Control Summary

Client Name: ENRX, Inc. Group Number: 2063392
Reported: 09/20/2019 17:03

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

# Explanation of Symbols and Abbreviations

*The following defines common symbols and abbreviations used in reporting technical data:*

| | | | |
|---|---|---|---|
| **BMQL** | Below Minimum Quantitation Level | **mL** | milliliter(s) |
| **C** | degrees Celsius | **MPN** | Most Probable Number |
| **cfu** | colony forming units | **N.D.** | non-detect |
| **CP Units** | cobalt-chloroplatinate units | **ng** | nanogram(s) |
| **F** | degrees Fahrenheit | **NTU** | nephelometric turbidity units |
| **g** | gram(s) | **pg/L** | picogram/liter |
| **IU** | International Units | **RL** | Reporting Limit |
| **kg** | kilogram(s) | **TNTC** | Too Numerous To Count |
| **L** | liter(s) | **µg** | microgram(s) |
| **lb.** | pound(s) | **µL** | microliter(s) |
| **m3** | cubic meter(s) | **umhos/cm** | micromhos/cm |
| **meq** | milliequivalents | **MCL** | Maximum Contamination Limit |
| **mg** | milligram(s) | | |

| | |
|---|---|
| **<** | less than |
| **>** | greater than |
| **ppm** | parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas. |
| **ppb** | parts per billion |
| **Dry weight basis** | Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis. |

**Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.**

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

**WARRANTY AND LIMITS OF LIABILITY** - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

# Data Qualifiers

| Qualifier | Definition |
|---|---|
| C | Result confirmed by reanalysis |
| D1 | Indicates for dual column analyses that the result is reported from column 1 |
| D2 | Indicates for dual column analyses that the result is reported from column 2 |
| E | Concentration exceeds the calibration range |
| K1 | Initial Calibration Blank is above the QC limit and the sample result is ND |
| K2 | Continuing Calibration Blank is above the QC limit and the sample result is ND |
| K3 | Initial Calibration Verification is above the QC limit and the sample result is ND |
| K4 | Continuing Calibration Verification is above the QC limit and the sample result is ND |
| J (or G, I, X) | Estimated value >= the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL) |
| P | Concentration difference between the primary and confirmation column >40%. The lower result is reported. |
| P^ | Concentration difference between the primary and confirmation column > 40%. The higher result is reported. |
| U | Analyte was not detected at the value indicated |
| V | Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference. |
| W | The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L. |
| Z | Laboratory Defined - see analysis report |
| B | Detection in the Blank |
| Q0 | LCS/LCSD Low |
| Q1 | LCS/LCSD High |
| Q2 | MS/MSD Low |
| Q3 | MS/MSD High |
| Q7 | LCS/LCSD RPD |
| Q8 | DUP RPD |
| Q9 | MS/MSD RPD |

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

RE: Workorder: J2301445 PFAS Testing

Dear Eric Arenberg:

Enclosed are the analytical results for sample(s) received by the laboratory on Saturday January 7, 2023. Results reported herein conform to the most current NELAC standards, where applicable, unless otherwise narrated in the body of the report. The analytical results for the samples contained in this report were submitted for analysis as outlined by the Chain of Custody and results pertain only to these samples.

If you have any questions concerning this report, please feel free to contact me.

Sincerely,

Jason Gebhardt

## Workorder Summary

### Batch Comments

**HPLj/1766 - E533 Analysis,Water**

The upper control criterion was exceeded for several surrogates/EIS in Continuing Calibration Verification (CCV) standards for analytical batch HPLj:1766, indicating increased sensitivity, however the associated target analytes passed CCV criteria. The client samples reported in this batch did not contain the associated target analytes in question. Since the apparent problem equates to a potential high bias, the data quality is not affected. No further corrective action was required.

The relative percent difference (RPD) for PFDS between the Laboratory Control Sample (LCS) and the Laboratory Control Sample Duplicate (LCSD) was outside control criteria due to relatively higher spike recovery in 4645748LCSD in comparison with 4645747. Spike recoveries in the LCS and LCSD were within acceptable limits, indicating the analytical batch was in control. No further corrective action was required.

**HPLj/1769 - PFAS Analysis,Soil**

The relative percent difference (RPD) for PFDS, PFNS, 8:2FTS and PFHpA between the Laboratory Control Sample (LCS) and the Laboratory Control Sample Duplicate (LCSD) was outside control criteria due to relatively higher spike recovery in 4648109LCSD in comparison with 4648108LCS, except for PFHpA which was higher in the LCS. Spike recoveries in the LCS and LCSD were within acceptable limits, indicating the analytical batch was in control. No further corrective action was required.

The upper control criterion was exceeded for several surrogates/EIS in Continuing Calibration Verification (CCV) standards for analytical batch HPLj:1769, indicating increased sensitivity, however the associated target analytes were within CCV criteria. The client samples reported in this batch did not contain the analytes in question. Since the apparent problem equates to a potential high bias, the data quality is not affected. No further corrective action was required.

| mg/L | Milligrams per liter | NR | Not recorded | VOC | Volatile organic compounds |

Turned on pump - large bubbles in flow line; tried adjustments to pump flow rate, etc. Unable to achieve stable flow rate and flow rate > 50 ml/min. Could not reach stabilization; could not sample location.

# Water Sampling Log

Project: ESTCP Vertebrae | Project No.: 30027244 | Page 1 of 2

Site Location: GMAAF | Date: 12/21/2021

Site/Well No.: VRTB-D-06 | Replicate No.: | Code No.:

Weather: | Sampling Time: Begin 1421 End 1425

## Evacuation Data

| | |
|---|---|
| Measuring Point | MA - horizontal well |
| MP Elevation (ft) | |
| Land Surface Elevation (ft) | |
| Sounded Well Depth (ft bmp) | |
| Depth to Water (ft bmp) | estimated 15 ft bgs |
| Water-Level Elevation (ft) | |
| Water Column in Well (ft) | |
| Casing Diameter/Type | |
| Gallons in Well | |
| Gallons Pumped/Bailed Prior to Sampling | |
| Sample Pump Intake Setting (ft bmp) | midpoint of 10 ft horizontal screen |
| Purge Time | begin 1236 end 1425 |
| Pumping Rate (ml/min) | 300 pump max |
| Evacuation Method | peristaltic |

## Field Parameters

| | |
|---|---|
| Temperature (°C) | |
| SpC (mS/cm) | |
| CND (mS/cm) | |
| Dissolved Oxygen (%) | |
| Dissolved Oxygen (mg/L) | |
| pH (s.u.) | |
| ORP (mV) | |
| Turbidity (NTU) | |
| Color | |
| Odor | |
| Appearance | |
| Sampling Method | peristaltic |
| Remarks | horizontal well, 5/8" diameter deep well, orange segment |

| Constituents Sampled | Container Description | Number | Preservative |
|---|---|---|---|
| PFAS 537 mod DOD QSM Table B-15 | 250 poly | 2 | none |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |

Sampling Personnel: K. Hasbrouck

**Well Casing Volumes**

| Gal./Ft. | | | | | |
|---|---|---|---|---|---|
| | 0.5" = 0.01 | 1-¼" = 0.06 | 2" = 0.16 | 3" = 0.37 | 4" = 0.65 |
| | 1" = 0.04 | 1-½" = 0.09 | 2-½" = 0.26 | 3-½" = 0.50 | 6" = 1.47 |

| | | | | | |
|---|---|---|---|---|---|
| bmp | Below measuring point | mL | Milliliter | NTU | Nephelometric turbidity units |
| °C | Degrees Celsius | mS/cm | Millisiemens per centimeter | PVC | Polyvinyl chloride |
| ft | Feet | msl | Mean sea level | s.u. | Standard units |
| gpm | Gallons per minute | N/A | Not applicable | umhos/cm | Micromhos per centimeter |
| mg/L | Milligrams per liter | NR | Not recorded | VOC | Volatile organic compounds |

deep, orange

# Water Sampling Log

Project: ESTCP Vertebrae | Project No.: 30027244 | Page: 1 of 2

Site Location: GAAF | Date: 12/21/2021

Site/Well No.: VRTB-D-P8 | Replicate No.: | Code No.:

Weather: | Sampling Time: Begin 1424 End 1427

## Evacuation Data

Measuring Point: NA - horizontal well

MP Elevation (ft):

Land Surface Elevation (ft):

Sounded Well Depth (ft bmp):

Depth to Water (ft bmp): estimated ~15 ft bgs

Water-Level Elevation (ft):

Water Column in Well (ft):

Casing Diameter/Type:

Gallons in Well:

Gallons Pumped/Bailed Prior to Sampling:

Sample Pump Intake Setting (ft bmp): midpoint of 10 ft horizontal screen

Purge Time: begin 1247 end 1427

Pumping Rate (ml/min): 300 pump max

Evacuation Method: peristaltic

## Field Parameters

Temperature (°C):

SpC (mS/cm):

CND (mS/cm):

Dissolved Oxygen (%):

Dissolved Oxygen (mg/L):

pH (s.u.):

ORP (mV):

Turbidity (NTU):

Color:

Odor:

Appearance:

Sampling Method: peristaltic

Remarks: horizontal well, 5/8" diameter deep well, purple segment

| Constituents Sampled | Container Description | Number | Preservative |

# Water Sampling Log

Project: ESTCP GSAAF | Project No.: 30027241 | Page: 1 of 3

Site Location: Grayling MI | Date: 4/13/2022

Site/Well No.: VRTB-D-01 | Replicate No.: | Code No.:

Weather: 49°F cloudy | Sampling Time: Begin 1345 End 1347

## Evacuation Data

Measuring Point:

MP Elevation (ft):

Land Surface Elevation (ft):

Sounded Well Depth (ft bmp):

Depth to Water (ft bmp):

Water-Level Elevation (ft):

Water Column in Well (ft):

Casing Diameter/Type:

Gallons in Well:

Gallons Pumped/Bailed Prior to Sampling:

Sample Pump Intake Setting (ft bmp):

Purge Time: begin 1151 end 1347

Pumping Rate (ml/min):

Evacuation Method: low flow

## Field Parameters

Temperature (°C):

SpC (mS/cm):

CND (mS/cm):

Dissolved Oxygen (%):

Dissolved Oxygen (mg/L):

pH (s.u.):

ORP (mV):

Turbidity (NTU):

Color:

Odor:

Appearance:

Sampling Method: low flow

Remarks: Vertical well

| Constituents Sampled | Container Description | Number | Preservative |
|---|---|---|---|
| PFAS | 250 ml HDPE | 2 | none |
| | | | |
| | | | |
| | | | |
| | | | |
| | | | |

Sampling Personnel: K. Hasbrouck

# APPENDIX J HYDRAULIC GRADIENT ANALYSIS

**Notes:**

1. Hydrographs calibrated to survey point datum (North American Vertical Datum 1988).
2. Horizontal hydraulic gradient calculations using hourly data from the three monitoring wells (Devlin, J.F., 2003. A spreadsheet method of estimating best -fit hydraulic gradients using head data from multiple wells. Groundwater, 41(3)).
3. Daily precipitation data with liquid snowfall equivalent processed to include precipitation data when air temperature above freezing. Data obtained from National Oceanic and Atmospheric Association (National Centers for Environmental Information) Grayling, MI Station (GHCND: USC00203391).

ESTCP ER20-5026
Grayling Army Air Field
