# Overview

- Synopsis of cyanide chemistry & contamination
- Is cyanide phytoremediation feasible?
- Can cyanide phytoremediation be implemented in the field?
- Are there ecological risks associated with cyanide phytoremediation?
- Can the efficacy of cyanide phytoremediation be modeled and predicted?

# Cyanide: sources and uses

- Biological sources
- Aluminum production
- Electroplating
- Manufactured gas industry (coal gasification)
- Ore heap leaching
- Precious metal mining
- Road salts (anticaking agent)

# Cyanide speciation

- **Free (CN<sup>-</sup>, HCN) or Simple (KCN, NaCN)**
  - Toxic, therefore tightly regulated
  - Among the top 30 on CERCLA list
- **Cyanates (-S-CN, O-CN<sup>-</sup>)**
  - Formed in the environment and *in vivo*
  - Not regulated
- **Metal cyanide complexes**
  - Formed in the environment or anthropogenically through reaction with cations (Fe, Zn, Ni)
  - Not regulated

# Iron cyanide complexes

## ■ Strong complexes

- Ferricyanide,  $\text{Fe}(\text{CN})_6^{3-}$
- Ferrocyanide,  $\text{Fe}(\text{CN})_6^{4-}$

## ■ Iron cyanide precipitates

- $\text{Fe}_4(\text{Fe}(\text{CN})_6)_3 = \text{Prussian blue}$
- $\text{Fe}_3(\text{Fe}(\text{CN})_6)_2 = \text{Turnbull's blue}$

## ■ Persistent

- Slow dissociation kinetics
- Resistant to biodegradation
- Photosensitive to strong UV light

# Examples: iron cyanide contamination

Former Manufactured  
Gas Plant site

# Is cyanide phytoremediation feasible?

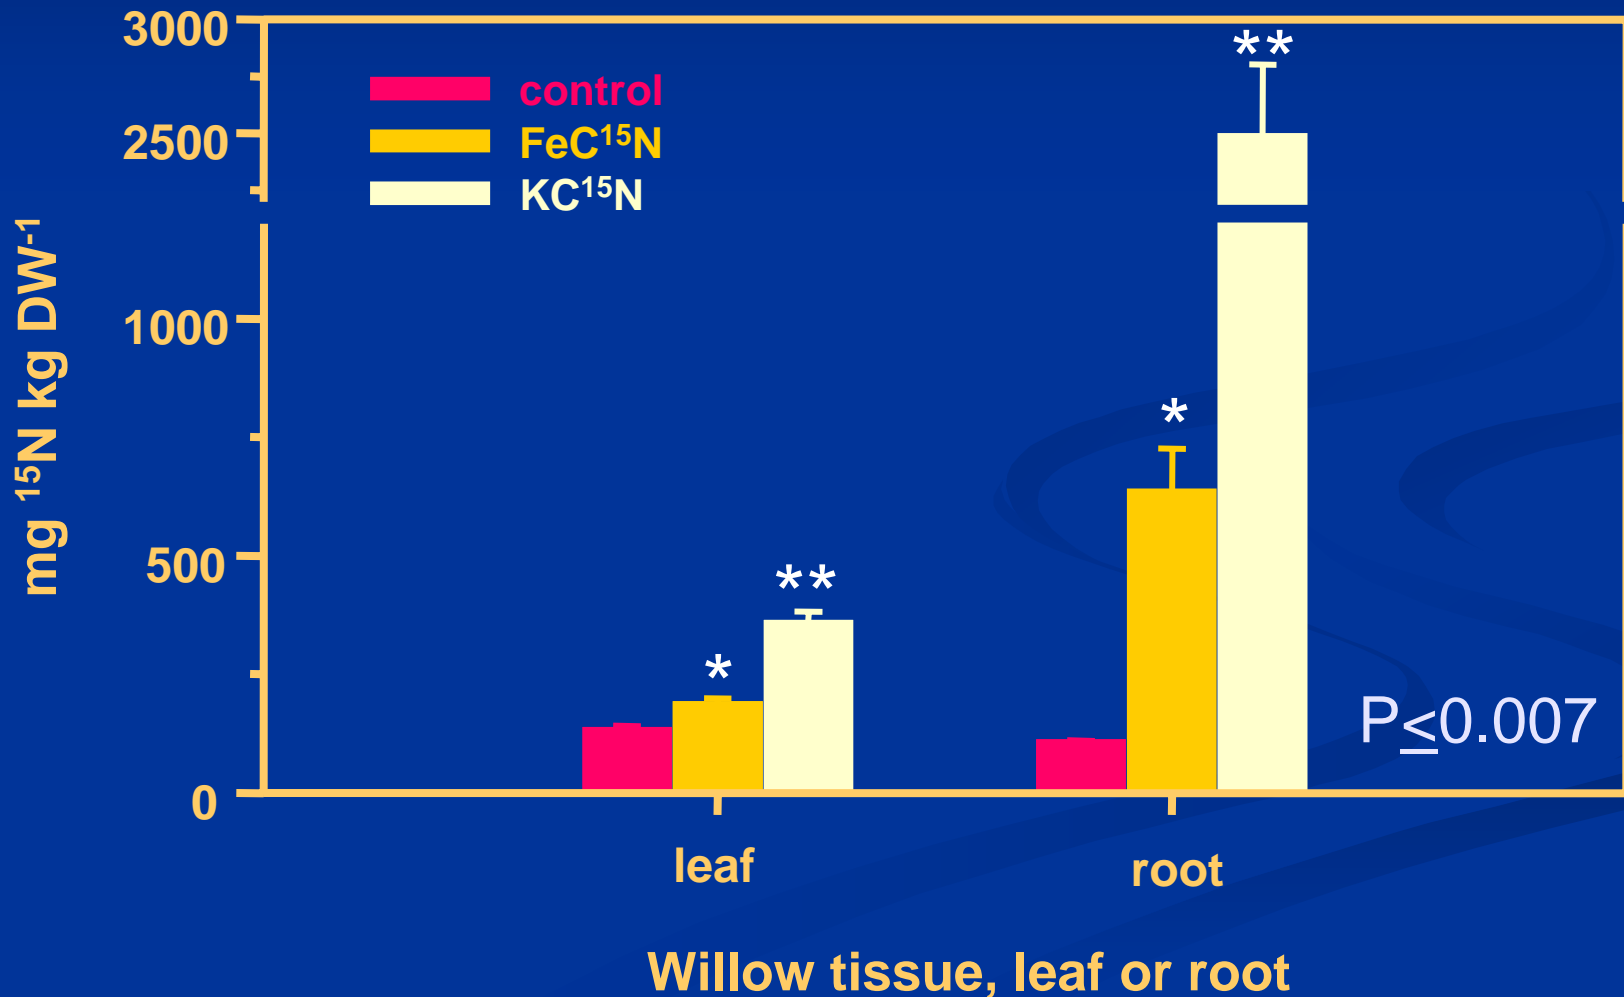

- Do plants transport cyanide?
- Do plants detoxify and/or metabolize cyanide?

# Hydroponic system schematic

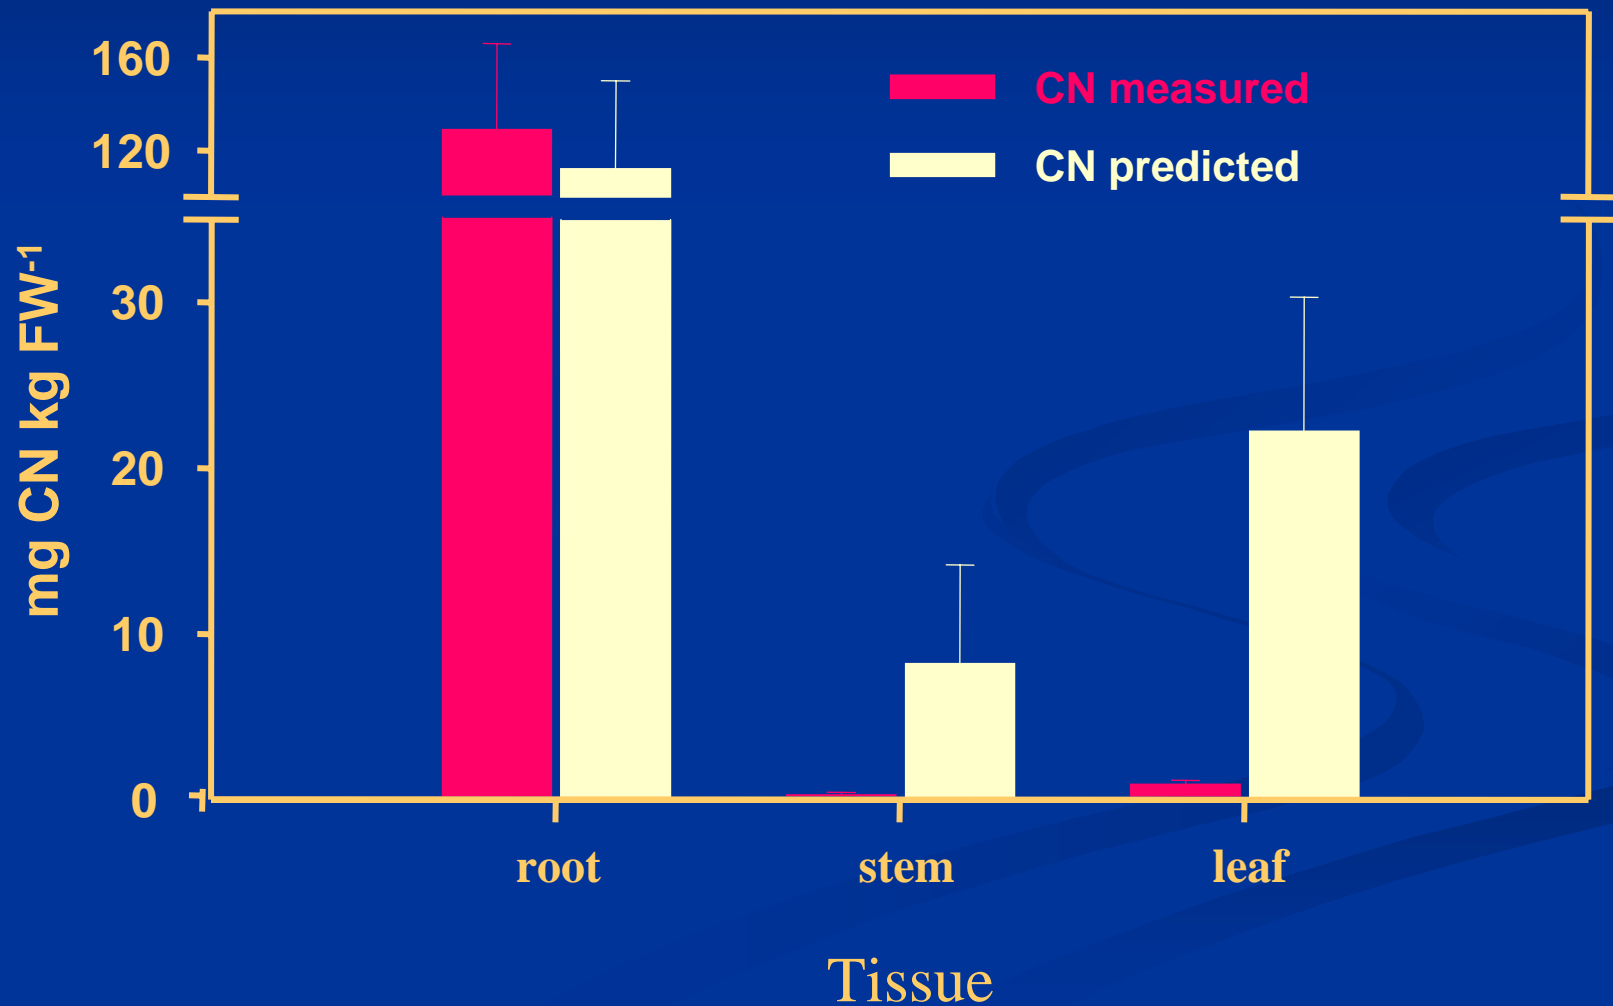

$^{15}\text{N}$ -labeled cyanide compounds were used to assess cyanide & iron cyanide transport

# $^{15}\text{N}$ -labeled cyanide compounds were used to assess cyanide metabolism

# $^{15}\text{N}$ -labeled cyanide compounds were used to assess iron cyanide metabolism

# Incorporation of $^{15}\text{N}$ from KCN into amino acids

Amino acid	Root $^{15}\text{N}$ abundance, %	Leaf $^{15}\text{N}$ abundance, %
Glu	30.6	2.3
Gln	12.9	1.7
Asn	30.2	2.5
Thr	5.8	2.5
Phe	22.4	9.3

Natural  
abundance:  
0.37%

# Conclusions:

## Cyanide transport and fate

- Roots of willow transport KCN and iron cyanides
- Plants treated with iron cyanides retain parent compound in roots, but translocate a metabolite(?) containing  $^{15}\text{N}$
- Plants do not accumulate exogenous cyanide in leaves, it is apparently incorporated into amino acids

# Field assessments of cyanide phytoremediation

Dr. Rajat Ghosh

# Field trials of cyanide phytoremediation

- Conducted by The Retec Group, Inc. in association with ALCOA, Inc. and others
- Tested on several sites
- Utilizes a constructed wetland approach

# Cyanide remediation with constructed wetlands

**Multiple cell  
design**

# Cyanide remediation with constructed wetlands

Multiple cell design

# Cyanide remediation with constructed wetlands

**Native vegetation**

# Cyanide remediation with constructed wetlands

- Preliminary results indicate
  - High degree (>95%) of iron cyanide removal
  - Photolytic degradation a contributing factor
  - Rapid removal of cyanide by native vegetation
- Future plans
  - Deployment to various industrial scenarios

# Are there ecological risks associated with cyanide phytoremediation?

# What data do we have pertinent to the question of risk?

- Exogenous cyanide **does not bioaccumulate** in plant tissues
- Cyanide is **assimilated** largely into amino acid pools
- Cyanide volatilization is detectable, but **minimal**
- Wildlife (including **amphibians**) utilize the constructed wetlands with no apparent adverse (acute) effects

Volatile cyanide monitoring

WE'RE WORKING ON A MORE EFFECTIVE MODEL TO PROTECT WILDLIFE FROM OUR TAILINGS DAM.....

# Modeling iron cyanide fate and transport in plant-soil-water systems

Dr. Joe Bushey

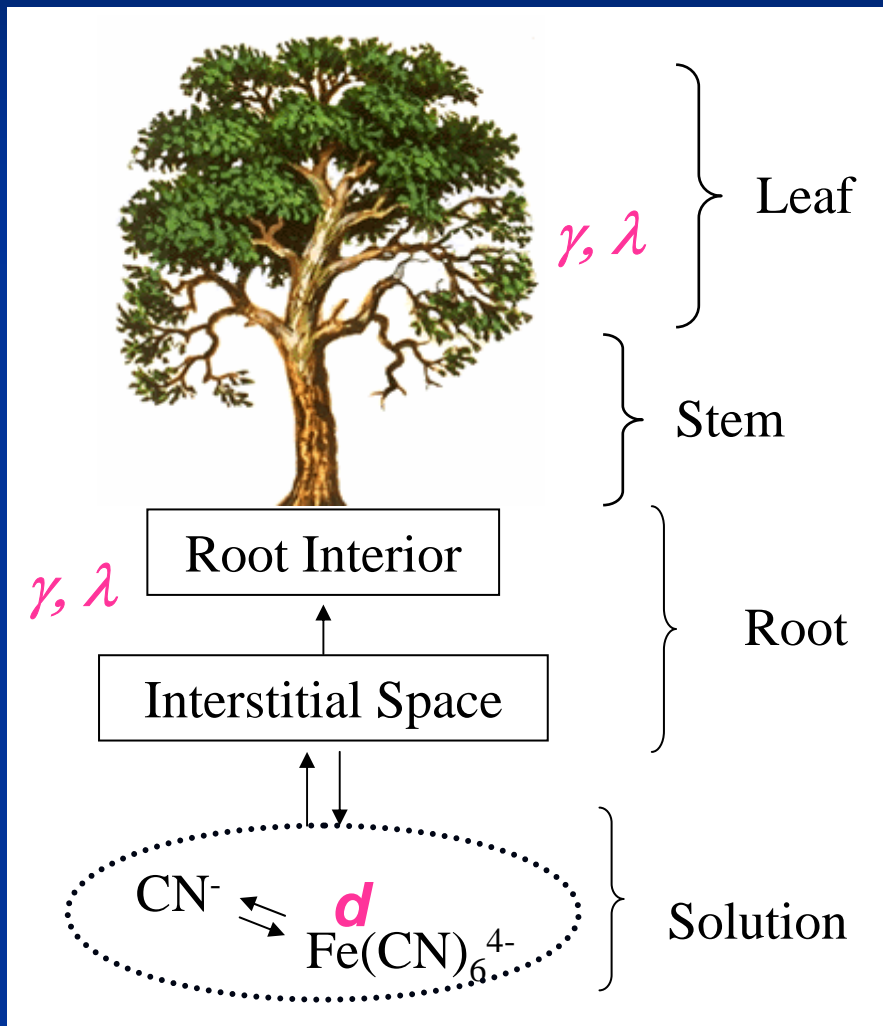

# Plant Cyanide Uptake Model Development: Transfer Processes in willow

- Advection ( $A$ )
  - $e_{ij}$  for root to stem
- Diffusion ( $D$ )
- Active uptake ( $U$ )
  - saturation kinetics
- Sorption ( $S$ )
  - 1<sup>st</sup>-order; reversible
- Volatilization ( $V$ )
  - HCN & assimilates
  - 1<sup>st</sup>-order

# Plant Cyanide Uptake Model Development: Chemical Considerations in willow

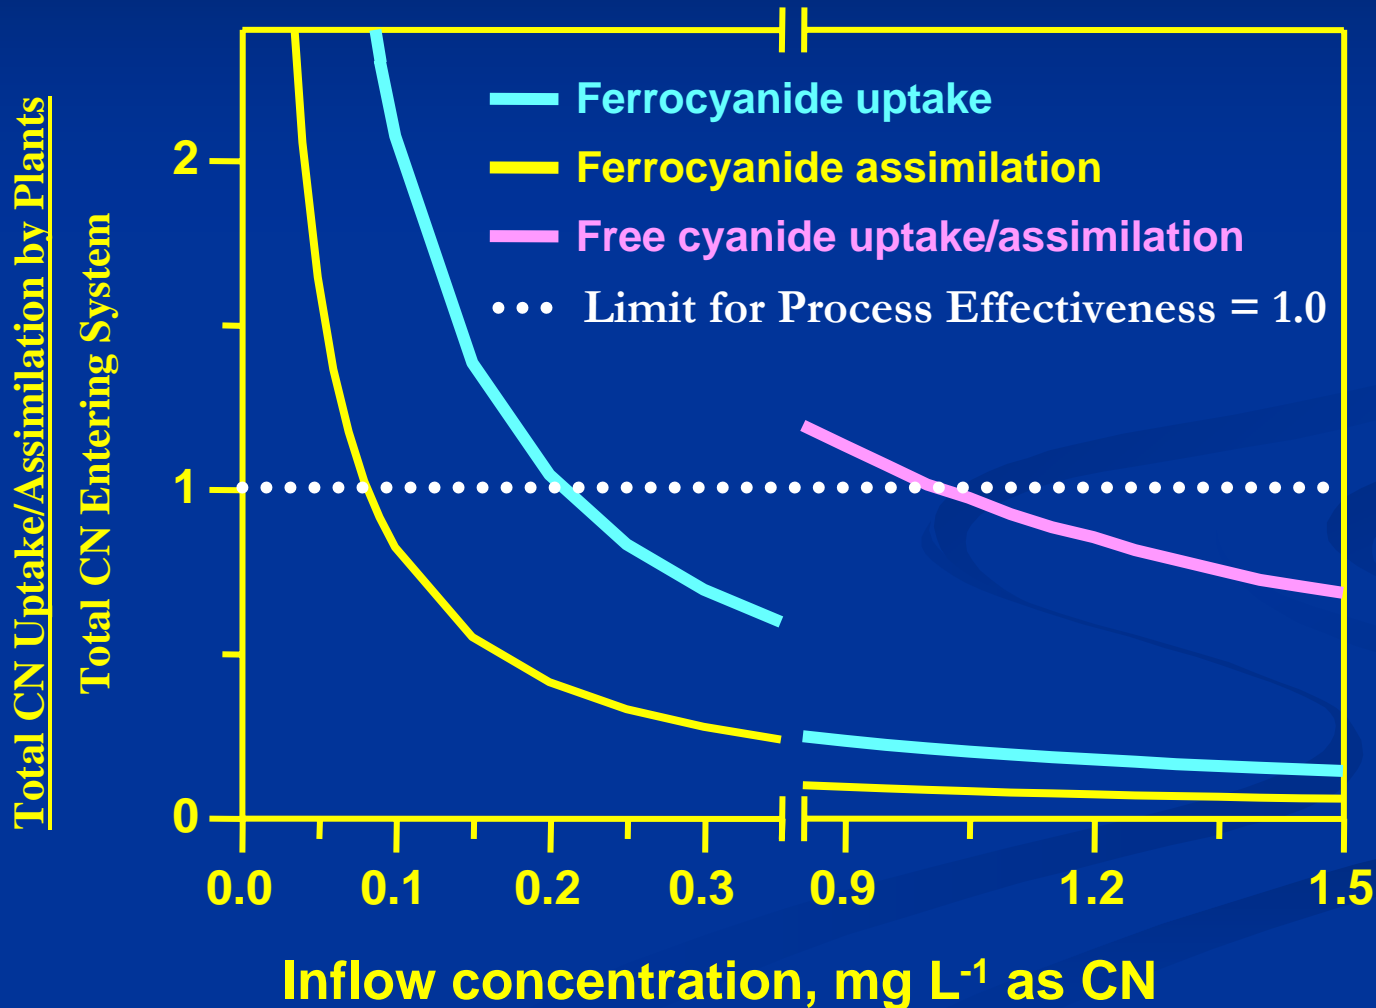

- $\text{Fe}(\text{CN})_6^{4-}$  dissociation
  - Chemical/Reversible ( $d$ )
  - 1<sup>st</sup>-order enzymatic ( $\gamma$ )
- $\text{CN}^-$ 
  - 1<sup>st</sup>-order assimilation ( $\lambda$ )
- Assimilates move with transpiration stream
- Ignored solid formation & plant growth

# Wetland fate model

# Engineering Feasibility

## Normalized uptake & assimilation

# Engineering Feasibility

## Normalized uptake & assimilation

- Normalizing data and adjusting parameters provides a means of applying the model to different scenarios
- A value of 1.0 represents the boundary of efficacy
  - $> 1.0 \rightarrow$  plants not reaching full potential
  - $< 1.0 \rightarrow$  results in breakthrough
- Results applicable to systems with
  - Ferrocyanide input  $\leq 0.2 \text{ mg L}^{-1}$  as CN
  - Free cyanide input  $\leq 1.2 \text{ mg L}^{-1}$  as CN

# Thank you!
