

Risk Assessment of Contaminated Sediments in River Basins

Theoretical Considerations and Pragmatic Approach

Ulrich Förstner (TUHH) & Susanne Heise (BIS)
et al.

River Basin Management and Monitoring of Sediments

- 1) Sediments and suspended matter (SPM) need to be included in monitoring programs for the WFD in order to address legacies of the past.
- 2) These data are required for a river basin wide risk assessment and management
- 3) Monitoring programs addressing SPM are needed in order to control management success of measures

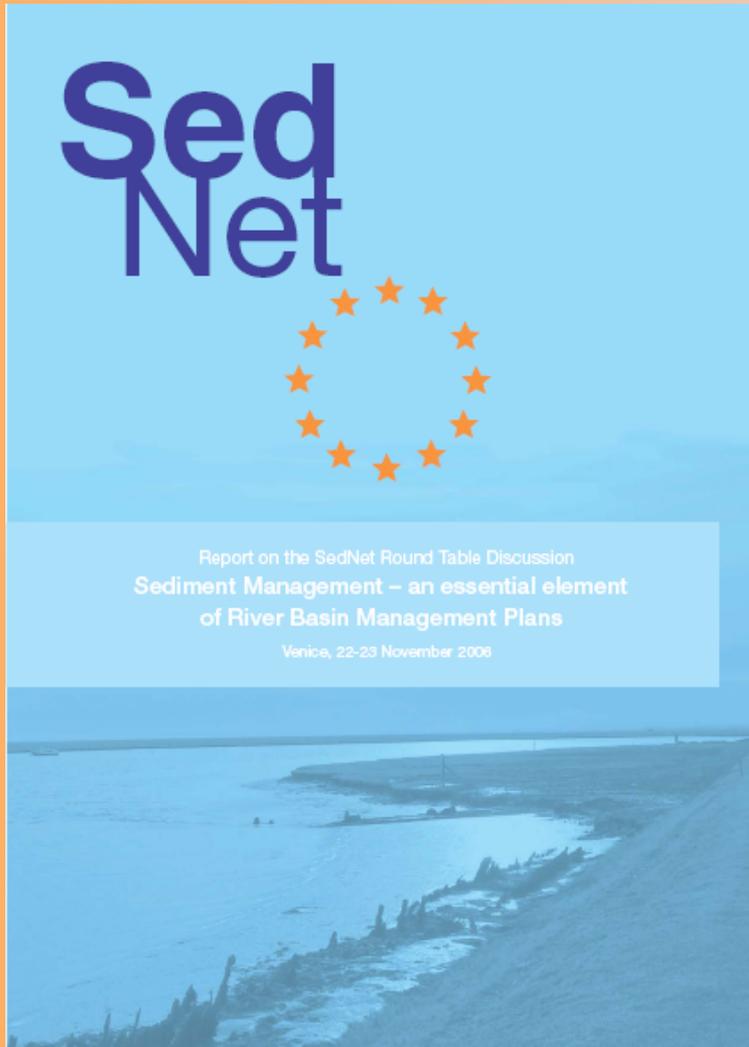

The objective of Sediment RB management

Prioritization of contaminated sites in a RB with regard to the risk that they pose to the WFD-objective and to uses of societal interest

(fishery, agriculture, recreation, shipping ...)

Report on the SedNet Round Table Discussion
Sediment Management – an essential element
of River Basin Management Plans

Venice, 22-23 November 2006

Case Studies

- Danube
- Douro
- Elbe
- Humber

The challenges to River Basins in Europe

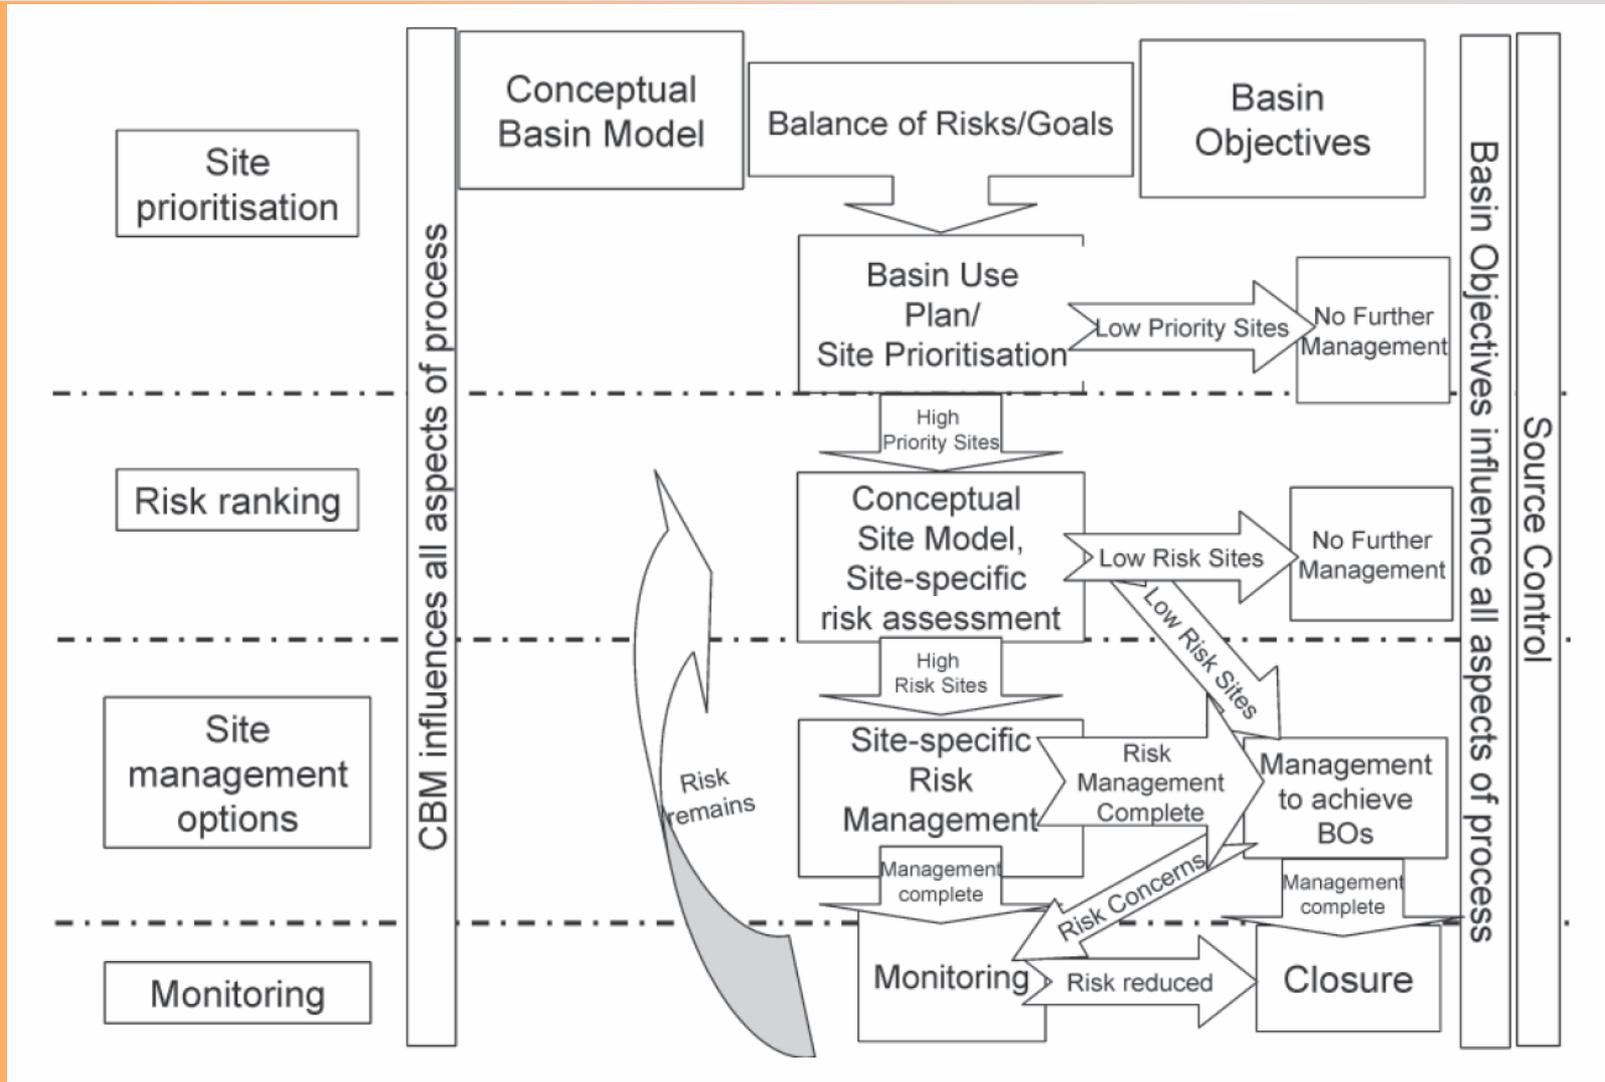

With regard to risk from contamination

- Legacies of the chemical industry
- Historic pollution around urban areas (e.g. Paris → Seine; Dresden, Hamburg → Elbe;)
- Mining activities

With regard to management

- liability? (e.g. GDR → FRG, sold companies)
- No financial resources at sites (e.g. poor federal states)
- increasing pressures from affected, downstream sites

Conceptual approach

Requirements for a practical approach

There is a high uncertainty!

- o Loads of SPM in the catchment
- o Transport of SPM (resuspension / sedimentation)
- o Particle bound contaminants concentration / loads (sources, distribution)
- o Risks from contaminated SPM

Reduce it asap & live with the rest.

- Use of different kind of data (centrifuge sampling, sediment traps, turbidity)
- Data on erosion potentials, catchment models, grain size data ...
- Long-term SPM-analysis & event-based data
- Use different lines of evidence!
- Transparent definition of risk (target levels)

For the moment!

Results need to indicate

- Prioritization of sites for measures
- The degree of confidence

The practical approach to prioritization

1) Identification of Substances of Concern

- RB specific contaminants
- Contaminants which endanger RB objectives

2) Identification of Areas of Concern

- Contaminated sites in the catchment

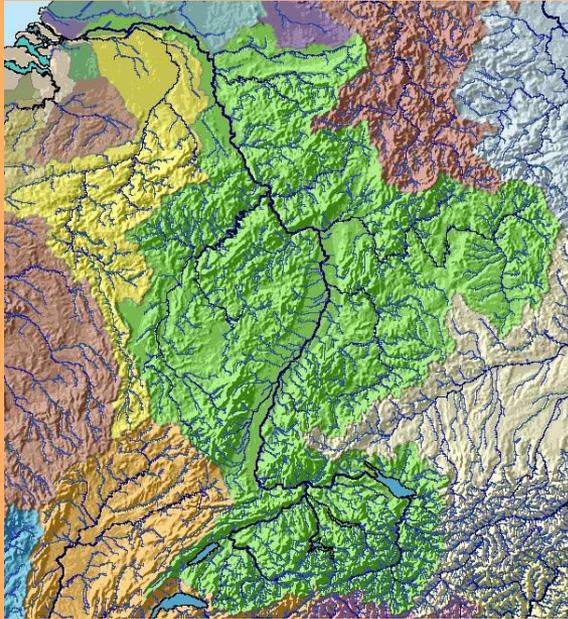

3) Identification of Areas of Risk

contaminated sites, from which sediments are transported downstream and under certain conditions (floods, low water levels) lead to exposure to hazards

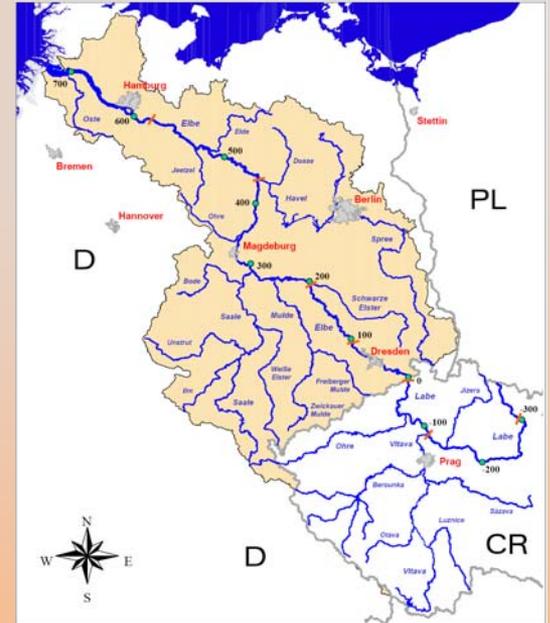

Examples

The Rhine basin

(commissioned by POR)

The Elbe basin

(commissioned by HPA and FGG)

Assessment of

- 1) Substances of Concern
- 2) Areas of Concern
- 3) Areas of Risk (in prep for the Elbe)

Rhine Basin: 1) Classification of S.o.C.

Table ES.1 Substances of concern and their ranking

Substances of concern	Hazard class
Cadmium	2
Chromium	1
Copper	1
Mercury	2
Nickel	1
Lead	1
Zinc	1
DDT+DDD+DDE (SUM)	2
Dioxins and Furans	2
Hexachlorobenzene	2
Polycyclic aromatic hydrocarbons	2
Polychlorinated biphenyls	2
TBT	1
Aldrin (Dieldrin, Endrin)	1
γ-hexachlorocyclohexane	1
Nonyl-phenol compounds	1

Class 2:

Cd and Hg:
High bioaccumulative potential
high toxicity

DDT, dioxins, HCB, PAH, PCB:
Highly persistent,
strongly adsorb to sediment
bioaccumulative potential

2. Classification of Areas of Concern:

Criteria:

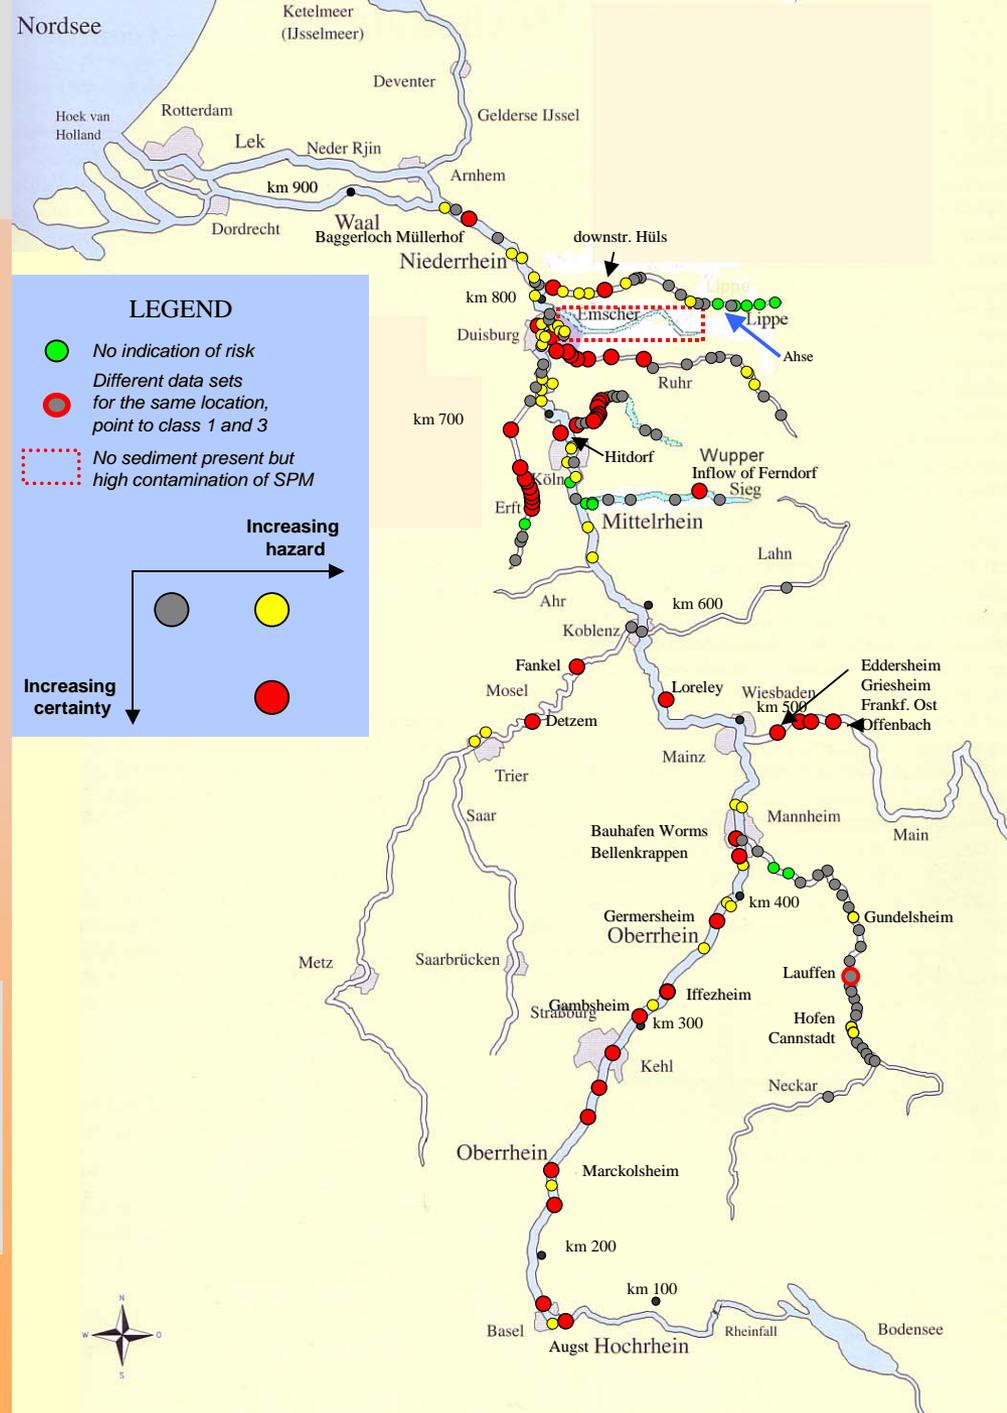

Exceedance of target value

Hazard rank of compound

Certainty of conclusion

(number of compounds, number of measurements)

- Class 1: potential hazard
- Class 2: potentially high hazard
- Class 3: high hazard with high certainty.

3. Areas of Risk

Weight of evidence – approach:

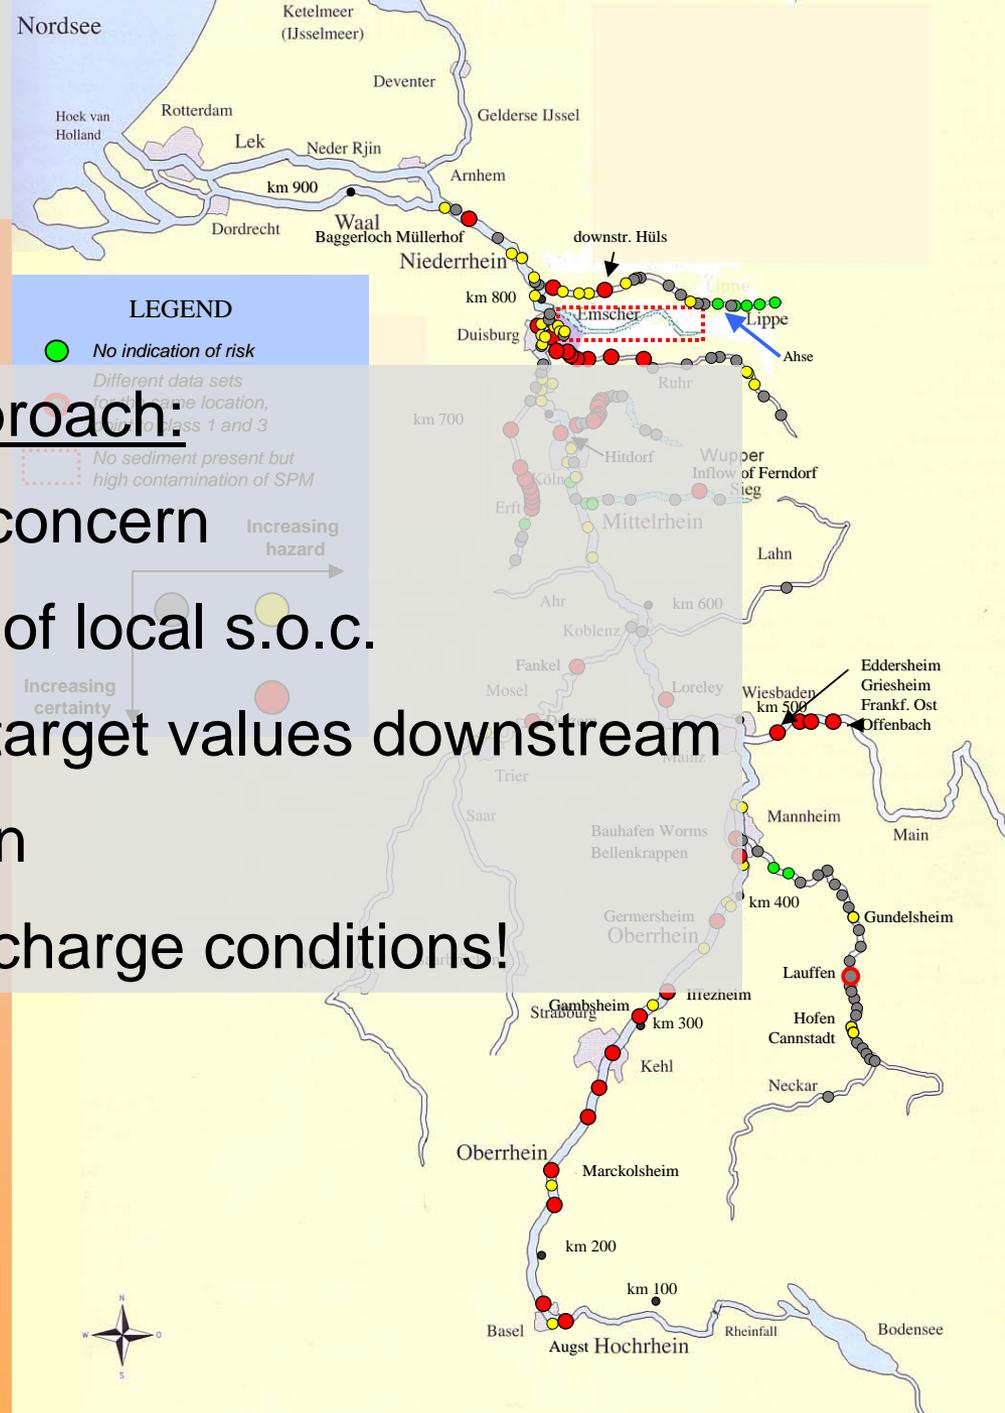

Classification as area of concern

Dominating hazard class of local s.o.c.

Potential exceedance of target values downstream

Indication of resuspension

under different discharge conditions!

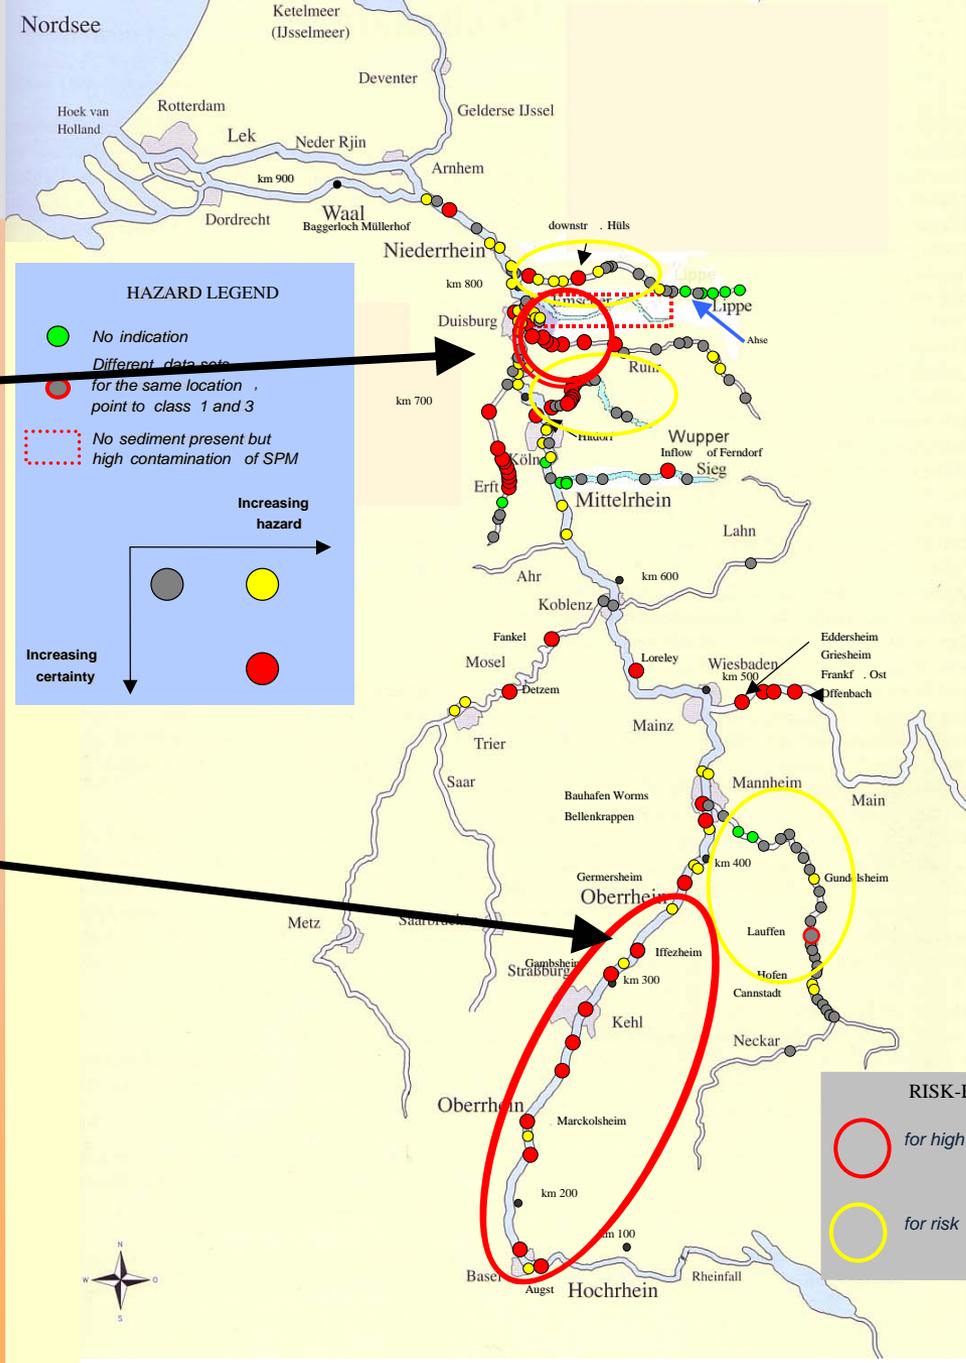

3) Areas of Risk

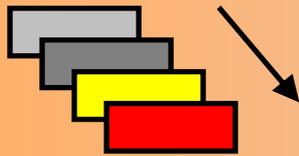

Sediment Risk Assessment on River Basin Level

River Ruhr at HQ₁₀₀ with regard to PAH and Cd

Barrages Upper Rhine Iffezheim at HQ₁ with regard to HCB

The Elbe Basin: S.o.C. and A.o.C.

Increasing exceedance of target values

Sediment Risk Assessment on River Basin Level

Areas of Concern → Areas of Risk

Conclusions

Prioritization of Risks in River Catchments:

- transparent process
- scientifically sound (weight of evidence approach)
- addressing confidence levels

Which site poses the largest risk to the RB objectives?

What are requirements of potential **measures**?

(→ programme of measures 2009)

It is then up to the decision makers to decide, which functions they value most and where to invest / direct financial resources

Sediments carry the memory of an industrial history into our present

Thank you for your attention.

Interdisciplinary process studies on sediment dynamics and pollutant mobility

The joint research project **SEDYMO** (Sediment Dynamics and Pollutant Mobility in Rivers') has been funded by the German Federal Ministry of Education and Research (**BMBF**) from 2002 to 2006. Its interdisciplinary approach focused on the transport and release of nutrients or pollutants into the water phase due to hydrodynamic processes.

Combined laboratory and field testing for sediment erosion stability (B. Westrich)

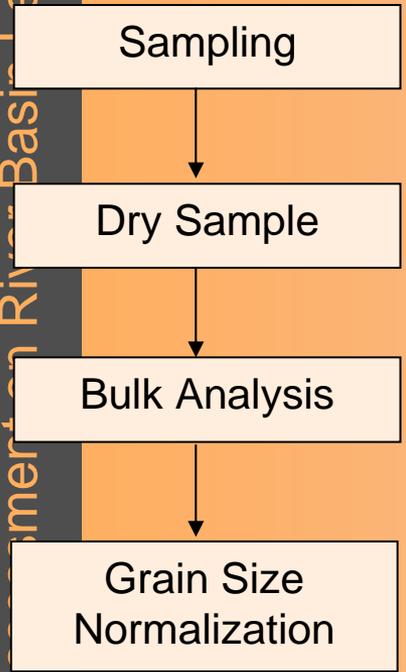

Data quality control and quality assurance (QC/QA) is a complex activity in water quality assessments. Problem areas have been identified by the European thematic framework METROPOLIS, for example:

Lack of representativeness: data do not reflect the reality that we want to represent – are simply not fit for purpose.

A too **high level of uncertainty** associated with the data collected makes the process of decision-making critical (in some cases the uncertainty is not expressed at all!).

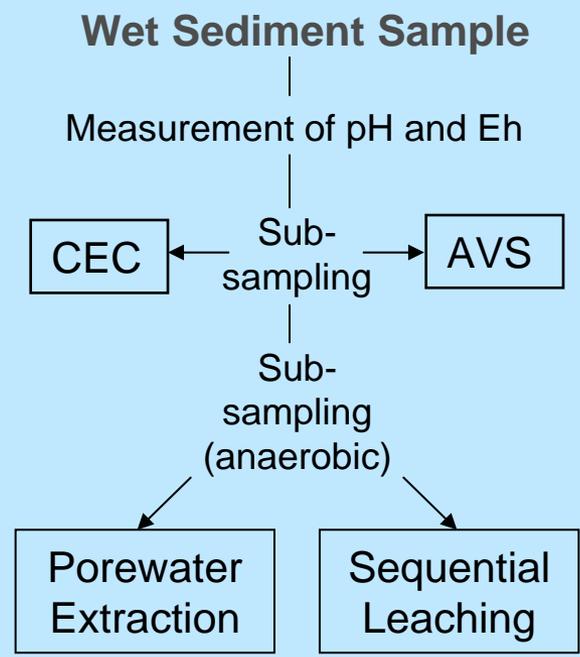

Traceability: This concept implies that measurement data are linked to stated references through an unbroken chain of comparison, all with stated uncertainties (e.g., *Philippe Quevauviller, Trends Anal Chem 23, 2004, pp. 217-236*).

Surveillance Monitoring

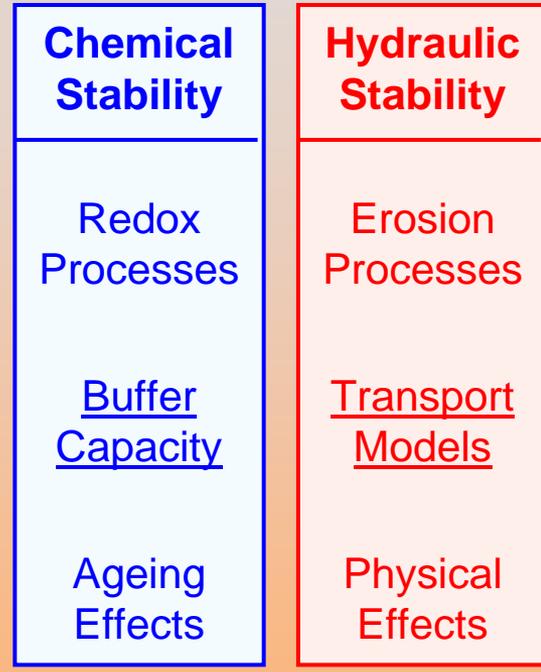

**Standard scheme,
± unbroken chain.
Uncertainties: Low**

In-Situ Sediment Characterization

**Selected chemical methods,
interpretation by specialists.
Uncertainties: Intermediate**

Spatial and Temporal Prognosis

**Extreme variations of
water flow: Scenarios
Uncertainties: High**

Particulate matter quality assessment in rivers (after Thomas & Meybeck 1992)

	Level A	Level B	Level C
Suspended matter (SPM)	Survey of SPM <u>quantity</u> through-out flood stage (when rising)	Survey of SPM <u>quality</u> at high flow (filtration or centrifugation)	<u>Full cover</u> of SPM <u>quality</u> throughout flood stage
Deposited sediment	Grab sample <u>at station</u> (end of low flow period)	<u>Longitudinal profiles</u> of grab samples (end of low flow period)	<u>Cores</u> at selected sites where conti-nuous sedimenta-tion is observed

Level A: simple monitoring, no requirement for special field and laboratory equipment

Level B: more advanced monitoring requiring special equipment and more manpower

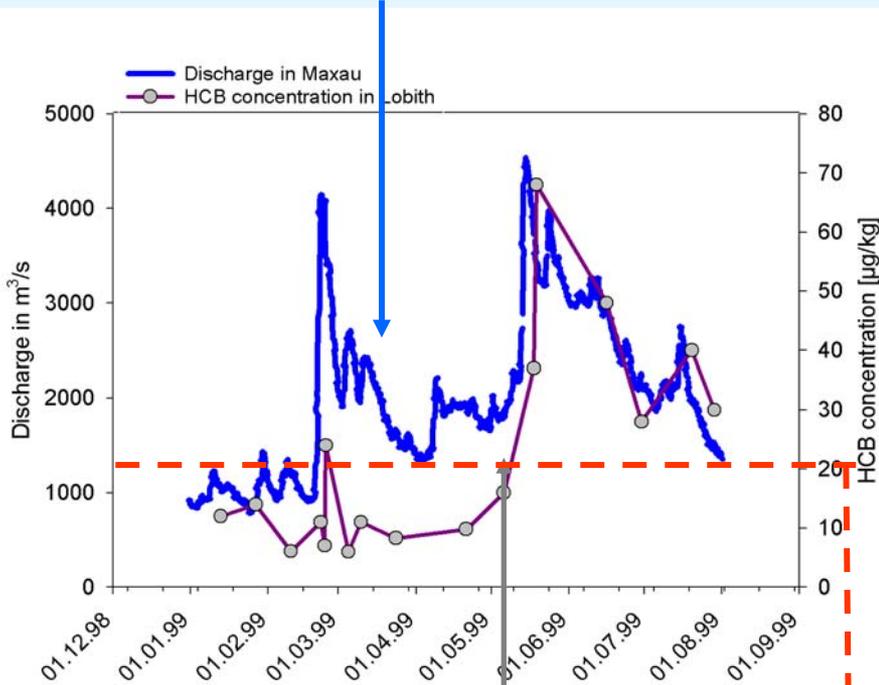

Level C: specialised monitoring which can only be undertaken by fully trained and equipped teams of personal

Progressive studies at sediments and suspended matter in Elbe and Rhine

Cadmium [mg/kg] in sediment coresim of Bucher Bracks (Elbe-km 376-385)
 Data of fraction < 20 μm, after Prange et al. 1997, Forschungszentrum Geesthacht

Blue line: High water discharges at Maxau, Rhine-km 362.3, in 1999

HCB concentration (SPM) at the D / NL border (Lobith)

CTT-action level for relocation at land or sea. E.g. HCB = 20 μg/kg

Hexachlorobenzene in reservoirs of the High and Upper Rhine

Indication of sediment resuspension due to high water discharges

Discharge	Erosion-potential	Load increase	Risk to Rotterdam
BAU	+/-	+	Existing
> HQ ₁	+	+++	Very high
> HQ ₁₀	++		Very high
> HQ ₅₀	+++		Very high

BAU = Business as usual; HQ₁, HQ₁₀, HQ₅₀ = Frequency of discharge event in number of years,; +/- no significant effect, + low effect, ++ significant effect and +++ strong effect
